

#### Create the Coil Terminal

- ▲ A coil terminal needs to be created in order to assign the current excitation.
- ▲ Select **Coil** from the objects tree.
- ▲ Select the menu item **3D Modeler > Surface > Section > YZ Plane**.

#### Separate the Grouped Terminals

- ▲ The result of the Surface > Section command, yields two terminals that are united. Since only one terminal is needed, the other terminal needs to be deleted, but first they need to be separated.
- ▲ Select the sheet object:
 
- ▲ Select the menu item **3D Modeler > Boolean > Separate Bodies**
- ▲ There are now 2 separate terminals. Delete the second terminal and rename the remaining object to **Terminal**.

fact that power efficiency as a ratio of performance to power consumption is equally influenced by performance improvements and architectural power reduction. Furthermore, efficiency can be influenced on all levels of today's system hierarchies from single cores all the way to distributed Grid environments. To improve execution and power efficiency requires progress in such diverse fields as program optimization, optimization of program scheduling and power reduction of idling system components for all levels of the system hierarchy. Improving computer system efficiency requires improving system performance and reducing system power consumption. To research and reach reasonable conclusions about system performance we need to not only understand the architectures of our computer systems and the available array of code transformations for performance optimizations but we also need to be able to express this understanding in performance models good enough to guide decisions about code optimizations for specific systems. This understanding is necessary on all levels of the system hierarchy from single cores to nodes to full high performance computing HPC systems and eventually to Grid environments with multiple systems and resources.
