Surface Effects and Contact Mechanics including Tribology XII J.Th.M. De Hossen,M. Hadfield,C.A. Brebbia,2015-04-21 The book contains papers from the twelfth in a series of biennial conferences first held in 1993 on the topics of contact mechanics and surface effects and their interaction In general structural components fail by wear corrosion and fatigue that is to say affected and initiated by surface conditions Consequently it is often appropriate to modify the surface layer of a base material or coat it so as to provide an enhanced performance or longer life However in many cases it

is the combined effect of wear and corrosion that is damaging contributing to complexity in determining the proper approach. The surface treatment chosen should be suitably related to the problem to be solved. The necessary thickness of the coating depends largely on the applied loading and environmental conditions. The papers in the book address novel protective layers for advances in sliding wear and low friction. The contents cover topics such as Experimental and Measurement Tests Surface Modification. Surface Problems in Contact Mechanics Thick and Thin Coatings Tribomechanics Computer Simulation.

responses mechanical properties such as impact strength hardness and surface roughness As cold chamber die casting is being popularly known for its efficient and accurate casting process which can process a broad range of castings with intricate shape easily hence it requires a lot of study in controlling the process variables with optimum combination of process variables to produce defect free and sound casting Therefore in the current study the process variables such as pouring temperature 725oC 750oC 775oC intensification pressure 170 kg cm2 180 kg cm2 190 kg cm2 type of coating oil graphite coating dycote graphite coating and dycote coating and type of cooling air cooling water cooling and oil cooling have been varied at three levels and 9 different experiments have been designed using Taguchi array L9 orthogonal array to assess the effects of different combinations of process variables over the mechanical properties impact strength hardness and surface roughness The study aims at selecting the optimum combination process variables on the basis of the responses resulted in the 9 experiments The graphs for the responses impact strength hardness and surface roughness against each process variables have been plotted and carefully observed to identify the significant process variable along with respective level of operation affecting the respective response From the overall study intensification pressure was concluded to be the most significant process variable with maximum contribution to the impact strength and surface finish The micrograph images captured corresponding to the respective levels of intensification pressure 170 kg cm2 180 kg cm2 190 kg cm2 revealed the presence of shrinkage porosity corresponding to lowest level of intensification pressure 170 kg cm2 and with further increase in intensification pressure led to a decrease in the extent of presence of porosity Dycote coating was considered as the most optimum coating with significant contribution to the hardness Air cooling and oil cooling were equally significant process variables with equivalent contribution to the mechanical properties Manufacturing, Characterisation and Properties of Advanced Nanocomposites Yu Dong, Alokesh Pramanik, Dongyan Liu, Rehan Umer, 2018-09-13 This book is a printed edition of the Special Issue Manufacturing Characterisation and Properties of CAD/CAM Robotics and Factories of the Advanced Nanocomposites that was published in J Compos Sci **Report** ,1964 <u>Future</u> S. A. Brebbia, Agnieszka Klemm, 2011 Until recently engineering materials could be characterized successfully using relatively simple testing procedures However advanced materials technology has led to the development of materials with complex meso micro and nano structures that can no longer be characterised with simple testing procedures Materials modelling and characterisation have become ever more closely intertwined Characterisation in essence connects the abstract material model with the real world behaviour of the material in question Characterisation of complex materials often requires a combination of experimental and computational techniques This book contains papers to be presented at the Fifth International Conference convened to facilitate the sharing of recent work between researchers who use computational methods those who perform experiments and those who do both in all areas of materials characterisation. The papers cover such topics as Advances in composites Thermal analysis Nano materials Damage mechanics Computational models and experiments Mechanical characterisation and testing Nano composites Energy materials Chemo mechanical problems Innovative experiments Recycled materials and Corrosion problems
