Read about each situation. Decide whether each question requires you to **substitute** or **solve** the given equation. In every case, show the steps that lead to your answer.

### A. Paper

A piece of paper is illustrated below. It is 100% taller than the paper it is made from. The paper is 100% wider than the paper it is made from. The paper is 100% thicker than the paper it is made from. The paper is 100% heavier than the paper it is made from.

$$P(x) = 100x^2$$

1. Determine the thickness of the paper after 10 years.

$$P(10) = 100(10)^2$$

2. How long will it take for the paper to be 100% thicker than the paper it is made from? (100% thicker means it is 200% of the original thickness.)

$$\begin{aligned}
 100x^2 &= 200x \\
 100x^2 - 200x &= 0 \\
 100x(x - 2) &= 0
 \end{aligned}$$

### B. Investment

The formula  $P(t) = 100(1.05)^t$  gives the value of an investment after  $t$  years.

1. How much will the investment be worth after 10 years?

$$P(10) = 100(1.05)^{10}$$

2. How much will the investment be worth after 10 years and 5 months?

$$P(10.5) = 100(1.05)^{10.5}$$

3. How long will it take for the investment to reach a value of \$100,000?

### C. Game System

A game system is illustrated below. It is 100% taller than the game system it is made from. The game system is 100% wider than the game system it is made from. The game system is 100% thicker than the game system it is made from. The game system is 100% heavier than the game system it is made from.

$$G(x) = 100x^2$$

1. How long will it take for the game system to be 100% thicker than the game system it is made from?

$$\begin{aligned}
 100x^2 &= 200x \\
 100x^2 - 200x &= 0 \\
 100x(x - 2) &= 0
 \end{aligned}$$

$$x = 2 \text{ years}$$

2. What will the cost of the game system be after 10 years?

$$G(10) = 100(10)^2$$

### D. Population

A population is illustrated below. It is 100% taller than the population it is made from. The population is 100% wider than the population it is made from. The population is 100% thicker than the population it is made from. The population is 100% heavier than the population it is made from.

$$P(t) = 100(1.05)^t$$

1. How long will it take for the population to reach a value of \$100,000?

2. How much will the population be worth after 10 years and 5 months?

$$P(10.5) = 100(1.05)^{10.5}$$

3. How long will it take for the population to reach a value of \$100,000?

Brill,2008-12-03 From 1972 to 1974 I was working on a PhD thesis entitled Multiple Server Queues with Service Time Depending on Waiting Time The method of analysis was the embedded Markov chain technique described in the papers 82 and 77 My analysis involved lengthy tedious derivations of systems of integral equations for the probability density function pdf of the waiting time After pondering for many months whether there might be a faster easier way to derive the integral equations I finally discovered the basic theorems for such a method in August 1974 The theorems establish a connection between sample path level crossing rates of the virtual wait process and the pdf of the waiting time This connection was not found anywhere else in the literature at the time I immediately developed a comprehensive new

methodology for deriving the integral equations based on these theorems and called it system point theory Subsequently it was called system point method or system point level crossing method SPLC or simply LC I rewrote the entire PhD thesis from November 1974 to March 1975 using LC to reach solutions The new thesis was called System Point Theory in Exponential Queues On June 12 1975 I presented an invited talk on the new methodology at the Fifth Conference on Stochastic Processes and their Applications at the University of Maryland Many queueing theorists were present
