Transfer Function Synthesis Using Resonators and Some Active RC Resonators John F. O'Neill, 1967 A system for synthesis of transfer functions of complex frequency having simple finite poles with finite Q and arbitrary zeros is proposed. The method uses generalized four parameter resonators connected in parallel and imbedded in an operational amplifier configuration such that lattice type two path transmission takes place. The resonators may be admittances of say discrete elements but emphasis is placed on the case of two port resonators characterized by their short circuit transfer admittance. Active RC two port resonators are developed using operational amplifiers. The two types required for general synthesis are sufficiently similar to permit building block type fabrication as integrated circuits using a single type of mask. The sensitivity of the resulting overall network to parameter errors and variations is calculated in general. The transmission sensitivity for a Butterworth six pole is calculated in detail as an example. Some aspects of the sensitivity of the active resonators are discussed. Experimental results verify that practical networks can be designed using the proposed system. Author

*Automatic Processing of Natural-Language Electronic Texts with NooJ* Linda Barone, Mario Monteleone, Max Silberztein, 2017-03-15 This book constitutes the refereed proceedings of the 10th International Conference NooJ 2016 held in Brno, Czech Republic in June 2016. The 21 revised full papers presented in this volume were carefully reviewed and selected from 45 submissions. NooJ is a linguistic development environment that provides tools for linguists to construct linguistic resources that formalise a large gamut of linguistic phenomena: typography, orthography, lexicons for simple words, multiword units and discontinuous expressions, inflectional and derivational morphology, local structural and transformational syntax and semantics.
