Mathematical Questions and Solutions, from the "Educational Times.", 1902 **The Porous Medium Equation** Juan

Luis Vazquez, 2007 The Heat Equation is one of the three classical linear partial differential equations of second order that form the basis of any elementary introduction to the area of PDEs and only recently has it come to be fairly well understood In this monograph aimed at research students and academics in mathematics and engineering as well as engineering specialists Professor Vazquez provides a systematic and comprehensive presentation of the mathematical theory of the nonlinear heat equation usually called the Porous Medium Equation PME This equation appears in a number of physical applications such as to describe processes involving fluid flow heat transfer or diffusion Other applications have been proposed in mathematical biology lubrication boundary layer theory and other fields Each chapter contains a detailed introduction and is supplied with a section of notes providing comments historical notes or recommended reading and exercises for the reader

Autonomous Search Youssef Hamadi, Eric Monfroy, Frédéric Saubion, 2012-01-05 Decades of innovations in combinatorial problem solving have produced better and more complex algorithms These new methods are better since they can solve larger problems and address new application domains They are also more complex which means that they are hard to reproduce and often harder to fine tune to the peculiarities of a given problem This last point has created a paradox where efficient tools are out of reach of practitioners Autonomous search AS represents a new research field defined to precisely address the above challenge Its major strength and originality consist in the fact that problem solvers can now perform self improvement operations based on analysis of the performances of the solving process including short term reactive reconfiguration and long term improvement through self analysis of the performance offline tuning and online control and adaptive control and supervised control Autonomous search crosses the chasm and provides engineers and practitioners with systems that are able to autonomously self tune their performance while effectively solving problems This is the first book dedicated to this topic and it can be used as a reference for researchers engineers and postgraduates in the areas of constraint programming machine learning evolutionary computing and feedback control theory After the editors introduction to autonomous search the chapters are focused on tuning algorithm parameters autonomous complete tree based constraint solvers autonomous control in metaheuristics and heuristics and future autonomous solving paradigms Autonomous search AS represents a new research field defined to precisely address the above challenge Its major strength and originality consist in the fact that problem solvers can now perform self improvement operations based on analysis of the performances of the solving process including short term reactive reconfiguration and long term improvement through self analysis of the performance offline tuning and online control and adaptive control and supervised control Autonomous search crosses the chasm and provides engineers and practitioners with systems that are able to autonomously self tune their performance while effectively solving problems This is the first book dedicated to this topic and it can be used as a reference for researchers engineers and postgraduates in the areas of constraint programming machine learning evolutionary computing and feedback control theory After the editors introduction to autonomous search the chapters are focused on
