The First Law of Mechanics in General Relativity & Isochrone Orbits in Newtonian Gravity Paul Ramond, 2023-04-30 The thesis tackles two distinct problems of great interest in gravitational mechanics one relativistic and one Newtonian The relativistic one is concerned with the first law of binary mechanics a remarkably simple variational relation that plays a crucial role in the modern understanding of the gravitational two body problem thereby contributing to the effort to detect gravitational wave signals from binary systems of black holes and neutron stars The work reported in the thesis provides a mathematically elegant extension of previous results to compact objects that carry spin angular momentum and quadrupolar deformations which more accurately represent astrophysical bodies than mere point particles The Newtonian problem is concerned with the isochrone problem of celestial mechanics namely the determination of the set of radial potentials whose bounded orbits have a radial period independent of the angular momentum The thesis solves this problem completely in a geometrical way and explores its consequence on a variety of levels in particular with a complete characterisation of isochrone orbits The thesis is exceptional in the breadth of its scope and achievements It is clearly and eloquently written makes excellent use of images provides careful explanations of the concepts and calculations and it conveys the author's personality in a way that is rare in scientific writing while never sacrificing academic rigor

[An Overview of General Relativity and Space-Time](#) Nicola Vittorio, 2022-12-29 This textbook equips Masters students studying Physics and Astronomy with the necessary mathematical tools to understand the basics of General Relativity and its applications It begins by reviewing classical mechanics with a more geometrically oriented language continues with Special Relativity and then onto a discussion on the pseudo Riemannian space times Applications span from the inner and outer Schwarzschild solutions to gravitational wave black holes spherical relativistic hydrodynamics and Cosmology The goal is to limit the abstract formalization of the problems to favor a hands on approach with a number of exercises without renouncing to a pedagogical derivation of the main mathematical tools and findings

[Variational Methods for Free Surface Interfaces](#) Paul Concus, Robert Finn, 2012-12-06 Vallombrosa Center was host during the week September 7 12 1985 to about 40 mathematicians physical scientists and engineers who share a

common interest in free surface phenomena This volume includes a selection of contributions by participants and also a few papers by interested scientists who were unable to attend in person Although a proceedings volume cannot recapture entirely the stimulus of personal interaction that ultimately is the best justification for such a gathering we do offer what we hope is a representative sampling of the contributions indicating something of the varied and interrelated ways with which these classical but largely unsettled questions are currently being attacked For the participants and also for other specialists the 23 papers that follow should help to establish and to maintain the new ideas and insights that were presented as active working tools Much of the material will certainly be of interest also for a broader audience as it impinges and overlaps with varying directions of scientific development On behalf of the organizing committee we thank the speakers for excellent well prepared lectures Additionally the many lively informal discussions did much to contribute to the success of the conference
