Sustainable nitrogen management in agrifood systems Food and Agriculture Organization of the United Nations, 2025-02-20. Nitrogen is an essential element in the natural environment forming critical compounds necessary for all living organisms. As it cycles through air, soil, and water, nitrogen is fundamental to ecosystem functionality. However, improper management of nitrogen in agrifood systems can degrade air, water, and soil quality while excessive extraction from soils leads to soil degradation, biodiversity loss, and exacerbation of climate change. This FAO report provides a comprehensive overview of nitrogen's role and the challenges associated with its use in agrifood systems. It explores solutions for improving nitrogen management in crop and livestock systems to enhance nitrogen use efficiency while reducing pollution. Additionally, it highlights the potential of circular bioeconomy approaches to optimize nitrogen management and minimize nitrogen losses. By adopting balanced nitrogen practices, agrifood systems can be transformed to ensure food security, improved nutrition, and sustainable livelihoods for farmers while minimizing negative environmental impacts.

Assessing the environmental impact of agriculture Prof. Bo P. Weidema, 2019-08-27. Assesses current best practice and methodological issues in life cycle assessment (LCA) methodology for agriculture. Looks in detail at particular types of environmental impact such as nutrient. Reviews the environmental assessment and optimization of sectors such as crops, ruminant, and other livestock production as well as by products.

Handbook of Research on Microbial Remediation and Microbial Biotechnology for Sustainable Soil Malik, Junaid Ahmad, 2021-06-11. The introduction of contaminants due to rapid urbanization and anthropogenic activities into the environment causes distress to the physio-chemical systems including living organisms which possibly is threatening the dynamics of nature as well as the soil biology by producing certain xenobiotics. Hence, there is an immediate global demand for the diminution of such contaminants and xenobiotics that can otherwise adversely affect the living organisms. Some toxic xenobiotics include synthetic organochlorides such as PAHs and some fractions of crude oil and coal. Over time, microbial remediation processes have been accelerated to produce better, more eco-friendly and more biodegradable solutions for complete dissemination of these xenobiotic compounds. The advancements in microbiology and biotechnology led to the launch of microbial biotechnology as a separate area of research and contributed dramatically to the development of areas like agriculture, environment, biopharmaceuticals, fermented foods, and more. The Handbook of Research on Microbial Remediation and Microbial Biotechnology for Sustainable Soil provides a detailed comprehensive account for

microbial treatment technologies bioremediation strategies biotechnology and the important microbial species involved in remediation The chapters focus on recent developments in microbial biotechnology in the areas of agriculture and environment and the physiology biochemistry and the mechanisms of remediation along with a future outlook This book is ideal for scientists biologists academicians students and researchers in the fields of life sciences microbiology environmental science environmental engineering biotechnology agriculture and health sciences
