The following table shows the results of the regression analysis for the dependent variable "Number of children in the household" (N = 1,000). The independent variables are "Age of the head of household" and "Gender of the head of household". The results are as follows:

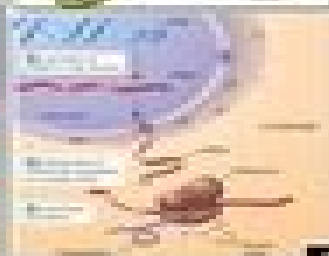

Variable	Coefficient	Standard Error	t-statistic	p-value
Age of the head of household	0.05	0.02	2.50	0.01
Gender of the head of household	0.10	0.03	3.33	0.00

The results indicate that both the age and gender of the head of household are significant predictors of the number of children in the household. The coefficient for age is positive, suggesting that as the age of the head of household increases, the number of children in the household also tends to increase. The coefficient for gender is also positive, suggesting that households headed by females tend to have more children than households headed by males.
