Schwartz, 2015-01-22 A seasoned national security professional and gifted writer offers an in depth analysis of what might happen after a nuclear attack on US soil. Matthew Kroenig author of *Exporting the Bomb* In the parlance of disaster preparedness right of boom refers to the terrifying moments after a crisis hits. In *Right of Boom* national security specialist Benjamin Schwartz examines what could happen after a nuclear explosion takes place in the United States the event that many experts have acknowledged as the greatest single national security threat we face. While many assume such an attack would automatically trigger a globally devastating exchange of nuclear attacks Schwartz demonstrates that the realities are far more nuanced and complex. Hypothesizing an explosion in downtown Washington DC Schwartz maps out the likely ramifications while going deep into history to explore the limited range of options available to a commander in chief. Drawing from his experience as an analyst at the Departments of Defense, State and Energy Schwartz offers a fully panoramic view of a terrifyingly real possibility. **Parliamentary Debates (Hansard).** Great Britain. Parliament. House of Commons, 2014 **Review of EPA's Integrated Risk Information System (IRIS) Process** National Research Council, Division on Earth and Life Studies, Board on Environmental Studies and Toxicology, Committee to Review the IRIS Process, 2014-06-25 The Integrated Risk Information System (IRIS) is a program within the US Environmental Protection Agency (EPA) that is responsible for developing toxicologic assessments of environmental contaminants. An IRIS assessment contains hazard identifications and dose response assessments of various chemicals related to cancer and noncancer outcomes. Although the program was created to increase consistency among toxicologic assessments within the agency, federal, state and international agencies and other organizations have come to rely on IRIS assessments for setting regulatory standards, establishing exposure guidelines and estimating risks to exposed populations. Over the last decade the National Research Council (NRC) has been asked to review some of the more complex and challenging IRIS assessments including those of formaldehyde, dioxin and tetrachloroethylene. In 2011 an NRC committee released its review of the IRIS formaldehyde assessment. Like other NRC committees that had reviewed IRIS assessments the formaldehyde committee identified deficiencies in the specific assessment and more broadly in some of EPA's general approaches and specific methods. Although the committee focused on evaluating the IRIS formaldehyde assessment it provided suggestions for improving the IRIS process and a roadmap for its revision. In case EPA decided to move forward with changes to the process Congress directed EPA to implement the report's recommendations and then asked the National Research Council to review the changes that EPA was making or proposing to make in response to the recommendations. *Review of EPA's Integrated Risk Information System (IRIS) Process* provides an overview of some general issues associated with IRIS assessments. This report then addresses evidence identification and evaluation for IRIS assessments and discusses evidence integration for hazard evaluation and methods for calculating reference values and unit

risks The report makes recommendations and considerations for future directions Overall Review of EPA s Integrated Risk Information System Process finds that substantial improvements in the IRIS process have been made and it is clear that EPA has embraced and is acting on the recommendations in the NRC formaldehyde report The recommendations of this report should be seen as building on the progress that EPA has already made
