- **Theoretical probability** is the expected result for an experiment with a very large number of trials.
- **Experimental probability** is the ratio of the number of times an outcome in an event actually occurs to the total number of completed trials.

Complete the table for each probability experiment. Record each probability.

1. Roll two number cubes and get an odd sum,  $P(\text{odd sum})$ .

| Theoretical Probability       | Number of Trials | Expected Results | Actual Results | Experimental Probability |
|-------------------------------|------------------|------------------|----------------|--------------------------|
| $\frac{18}{36} = \frac{1}{2}$ | 10               |                  | odd            |                          |

2. Toss 2 coins and get 1 heads and 1 tails,  $P(\text{heads, tails})$ .

| Theoretical Probability | Number of Trials | Expected Results | Actual Results | Experimental Probability |
|-------------------------|------------------|------------------|----------------|--------------------------|
|                         | 10               |                  | heads, tails   |                          |

3. Roll two number cubes and get a sum greater than 7,  $P(\text{sum} > 7)$

| Theoretical Probability | Number of Trials | Expected Results | Actual Results | Experimental Probability |
|-------------------------|------------------|------------------|----------------|--------------------------|
|                         | 60               |                  | sum $> 7$      |                          |
