Roberts, 2012-04-24 Discusses the uses misuses dangers and benefits of statin drugs counseling patients on how to make informed choices about side effects and lifestyle changes that can promote cardiovascular health **The Effect of Clinical Trial Regulation Changes on Statin Therapy for**

Cardiovascular Disease in Randomized Controlled Trials Savannah Grace Browning, 2020 Cardiovascular disease continues to be of concern in many developed countries especially in the United States where 1 out of 4 deaths is due to heart disease High blood cholesterol levels are thought to be one of the major risk factors for heart disease therefore statin therapy alone or in combination with lifestyle changes is one of the most common preventions and treatments for heart disease From 2011 2012 approximately 28% of adults in the U S 40 reported taking a cholesterol lowering drug in the past 30 days of those 28% 93% report taking a statin The believed effectiveness of statins stems from the multitude of clinical

trials and meta analyses reporting statins were effective in decreasing the incidence of cardiac events Clinical trial regulations have been modified substantively from time to time with one of the largest set of changes being put into place in 2004 The changes put into place in 2004 require 1 clinical trials to be registered with a clinical trial registry 2 registry to be kept up to date with all trial design changes 3 all data and results must be published as it is available Based on a set of visual evaluations a recent comprehensive evaluation concluded that the statin clinical trials occurring after this large scale change in regulations reporting that statins are not efficacious as originally believed and are likely dangerous In this thesis de novo meta analyses were performed evaluating the efficacy of statin therapy on the reduction in the incidence of primary cardiac outcomes cardio related mortality and all cause mortality We posited that the 2004 regulations had an impact on reports of efficacy and thus subgroup analyses were performed distinguishing the studies that occurred prior to the major clinical trial regulation changes in 2004 pre 2004 and those that occurred after post 2004 Studies fitting the inclusion and exclusion criteria were identified pertinent data were extracted and data analyses were performed using the inverse variance heterogeneity model In the total combined pooled analysis studies showed results consistent with many other meta analyses that statin therapy was effective in reducing primary cardiac event incidence However among the subgroup of studies occurring after the 2004 changes efficacy of statin therapy in reducing primary cardiac event incidence did not meet statistical significance A similar pattern was seen in the analysis for cardio related mortality and all cause mortality We conclude that the clinical trial regulation changes that went into place in 2004 appeared to have an effect the published outcomes of clinical trials of statins The clinical trial regulation changes altered the apparent efficacy of statin therapy regarding a decrease Among trials conducted after the regulations there was not a statistically significant reduction in the incidence of primary cardiac outcomes cardio related death and all cause mortality This information shows that it will be important to continue to critically evaluate all new clinical trials as well as the meta analyses that include a large portion of pre 2004 studies

Focus on Statin Research B. A. Wong,2006 The statins are a relatively new group of drugs used to lower blood cholesterol levels A high cholesterol level increases a person's risk of having a heart attack or stroke The long term use of statins reduces the risk of such an event and can increase the life expectancy of people with a history of heart disease The statins work by blocking an enzyme in the body that is involved in the production of LDL cholesterol especially in the liver

This enzyme is known as HMG coenzyme A reductase The statins are the most effective group of drugs for lowering the levels of LDL cholesterol in the body Potential side effects include muscle cramps and gastrointestinal upsets These are usually resolved on temporarily lowering the dose Liver enzyme derangements may occur which generally return to normal after briefly discontinuing the drug Some report headaches Other side effects occur rarely This new book examines new research on this controversial drug Statin Drugs Duane Graveline,2004
