Human reproduction

Human reproduction is sexual reproduction involving male and female reproductive cells called gametes. The reproductive system includes organs called gonads that produce gametes and hormones; ducts for transport, storage and composition of gametes; accessory organs and glands for fluid secretion; and internal genitalia. Reproduction is regulated by hormones produced by the gonads, the hypothalamus and the pituitary gland. Fertilisation involves the introduction of sperm into the vagina. The sperm travels through the female reproductive tract until it encounters an ovocyte, a female sex cell. Fertilisation can then take place.

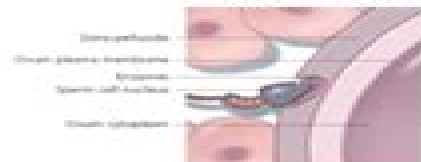

Male reproductive system

The adult male reproductive system is a complex of two primary external structures, the testes and the penis. The testes are divided into thousands of tiny compartments or lobules containing seminiferous tubules, tightly coiled structures where sperm formation takes place.

The testes are situated in a sac called the scrotum, which provides support and regulates the position of the testes relative to the body. The scrotum moves because of the need to keep the testes at a constant temperature to maintain the proper temperature within the testes for sperm formation.

Seminiferous tubules produce sperm cells. Sperm cells are released into the epididymis, which is located in the scrotum. Sperm cells are responsible for moving through the urethra and into the penis and passing the development of male secondary sex characteristics.

Fertilization

The upper portion of the vagina leads to the vaginal canal for fertilization. Millions of sperm travel through the female reproductive tract, utilizing cilia, to reach the egg. Within a sperm, the nucleus contains the genetic material. The sperm travels through the vagina, the cervix, the uterus, and the fallopian tube, where it meets the egg. The sperm enters the egg, and the sperm nucleus and associated material merge with the egg. Other sperm are prevented from entering by a chemical change in the zona pellucida.

The egg nucleus contains the chromosomes of the egg and sperm combine, and a fertilized egg, or zygote, is formed. The change process starts with a nuclear division, producing 2 identical cells called blastomeres.

Female reproductive system

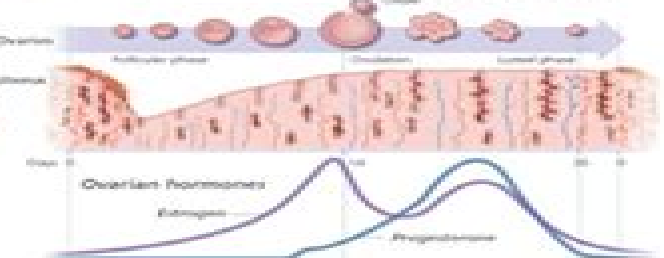

The internal structure of the adult female reproductive system includes the vagina, uterus, ovaries and fallopian tubes. These structures form a pathway allowing the release of an egg cell, fertilization, its growth and delivery of a developed fetus. The vagina is a muscular canal that receives the penis and provides a passage for sperm and menstrual discharge. The uterus is a hollow pear-shaped organ with muscular walls that contract during childbirth. The lower lining of the uterus is the endometrium, which sheds during each menstrual cycle in preparation for implantation by a fertilized egg. This lining is shed during menstruation if fertilization does not occur.

Spermatozoon

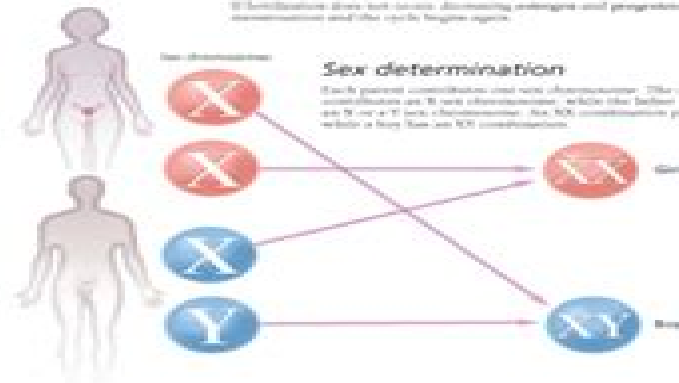

The ovaries, located on each side of the uterus, are responsible for producing ova as well as the female sex hormones estrogen and progesterone. Estrogens are responsible for the development of the female reproductive structures, sexual characteristics, and breast development. Progesterone prepares the uterus lining for implantation of a fertilized egg and is necessary for breast milk production. The ovaries are connected to the uterus by the uterine tubes, narrow ducts that provide a passageway for the egg to reach the uterus.

Ovulation phases

Ovulation & the menstrual cycle

The menstrual cycle refers to the sequence of events that occurs in the endometrium, the lining of the uterus. The cycle normally lasts approximately 28 days. The purpose is to prepare the uterus for possible pregnancy. The menstrual cycle is governed by the endocrine system. If fertilization does not occur, declining estrogen and progesterone levels initiate menstruation and the cycle begins again.

Sex determination

Each parent contributes one sex chromosome. The mother always contributes an X sex chromosome, while the father contributes either an X or a Y sex chromosome. An XX combination produces a girl, while a XY sex is an XY combination.
