## **Handbook Of Cognition And Aging:**

*The Cambridge Handbook of Cognitive Aging* Ayanna K. Thomas, Angela Gutchess, 2020-05-28 Decades of research have demonstrated that normal aging is accompanied by cognitive change. Much of this change has been conceptualized as a decline in function. However, age-related changes are not universal, and decrements in older adult performance may be moderated by experience, genetics, and environmental factors. Cognitive aging research to date has also largely emphasized biological changes in the brain with less evaluation of the range of external contributors to behavioral manifestations of age-related decrements in performance. This handbook provides a comprehensive overview of cutting edge cognitive aging research through the lens of a life course perspective that takes into account both behavioral and neural changes. Focusing on the fundamental principles that characterize a life course approach: genetics, early life experiences, motivation, emotion, social contexts, and lifestyle interventions, this handbook is an essential resource for researchers in cognition, aging, and gerontology.

*The Handbook of Aging and Cognition* Fergus I.M. Craik, Timothy A. Salthouse, 2011-03-15 Cognitive aging is a flourishing area of research. A significant amount of new data, a number of new theoretical notions, and many new research issues have been generated in the past ten years. This new edition reviews new findings and theories, enables the reader to assess where the field is today, and evaluates its points of growth. The chapters are organized to run from reviews of current work on neuroimaging, neuropsychology, genetics, and the concept of brain reserve through the mainstream topics of attention, memory, knowledge, and language to a consideration of individual differences and of cognitive aging in a lifespan context. This edition continues to feature the broad range of its predecessors while also providing critical assessments of current theories and findings.

**The Handbook of Aging and Cognition** Fergus I. M. Craik, Timothy A. Salthouse, 1992 The study of age-related changes in cognitive processes is flourishing as never before, making the area an exciting one for a growing number of researchers. In addition, cognitive aging research is moving out from its traditional roots in experimental and developmental psychology, creating increased contact with cognitive neuropsychology and cognitive neuroscience. To reflect these changes in the field, this volume includes chapters on abnormal aging, the neuroscience of aging, and applied cognitive psychology, along with the core section on basic cognitive processes. While other recent compilations of research in this area have given relatively brief overviews of the literature, the contributors were given space to review each topic in depth, asked to evaluate the field, not simply their own contributions, and to provide critical commentaries from their personal perspectives. Couched most often in terms of cognitive or information processing models, the general perspective of the contributors is a biologically based account of aging. This shared viewpoint gives the volume particular coherence in its treatment of theories and data. Topics covered include age differences in attention, perception, memory, knowledge, representation, reasoning, and language, as well as their neuropsychological and neurological correlates and practical implications.
