This system is an electronically controlled camshaft timing system that allows variable timing for the intake and exhaust camshafts.

The valves are driven by a timing chain. The control unit drives the associated camshaft. The timing chain is tensioned using a variable timing chain tensioner.

The intake camshaft is driven by a timing chain for the active camshaft tensioner.

This CMP sensor monitors the valve cover.

Timing chain replacement does not require the variable camshaft timing control unit to be disconnected.

For double-free operation of the variable timing system and optimum engine performance, it is essential to adhere precisely to valve timing adjustment procedures.

A special tool is needed to fix the camshafts in the adjustment position.

Remember that this special tool must not be used to keep the camshaft from rotating when mounting the camshaft sprockets. They may only be kept from rotating by using the hexagon, which has been specially provided for this purpose.

Advantages of variable camshaft timing (VCT):

- Lower fuel consumption due to improved volumetric efficiency
