the advancement of neuroimaging techniques such as PET and fMRI in the last decade basic questions on the psychological mechanisms underlying modulatory effects of deception and information concealment on behavioral autonomic and brain responses are still poorly understood This Research Topic brings together contributions from researchers in experimental psychology psychophysiology and neuroscience focusing on the understanding of the broad concept of deception including the detection of concealed information with respect to basic research questions as well as applied issues This Research Topic is mainly composed of original research articles but reviews and papers elaborating on novel methodological approaches have also been included Experimental methods include but are not limited to behavioral autonomic electroencephalographic or brain imaging techniques that allow for revealing relevant facets of deception on a multimodal level While this Research Topic primarily includes laboratory work relevant issues for the field use of such methods are also discussed

Each chapter in this book analyzes the ways in which research findings from IDRC-supported projects have contributed to an evolution of thinking and discusses successes and challenges in using ICTs as tools to address development issues.
