

Separating a Synthetic Pain Relief Mixture

JOY Chemistry, Inc., 1001 N. Fairview Drive
 New Richmond, Indiana 46555

Introduction

This unit illustrates separation of mixtures in several steps. It uses three separation techniques: extraction, distillation, and filtration. The mixture is first extracted with a solvent, then the solvent is removed by distillation. The remaining mixture is then separated by filtration. The procedure is repeated until the mixture is separated into its components. The procedure is repeated until the mixture is separated into its components.

Objectives

- Identify the components of a mixture
- Perform a separation technique
- Interpret the results of a separation

Background

Extraction is a separation technique used to separate mixtures. It is based on the principle that different substances have different solubilities in different solvents. For example, a mixture of oil and water can be separated by adding a solvent that is more soluble in oil than in water. The oil will then move into the solvent, leaving the water behind. This process is repeated until the mixture is separated into its components. The procedure is repeated until the mixture is separated into its components.

The ability to separate mixtures is a fundamental skill in chemistry. It is used in many different ways, from separating mixtures of chemicals to separating mixtures of biological samples.
