Walas, 1991 Modelling with Differential Equations in Chemical Engineering covers the modelling of rate processes of engineering in terms of differential equations While it includes the purely mathematical aspects of the solution of differential equations the main emphasis is on the derivation and solution of major equations of engineering and applied science Methods of solving differential equations by analytical and numerical means are presented in detail with many solved examples and problems for solution by the reader Emphasis is placed on numerical and computer methods of solution A key chapter in the book is devoted to the principles of mathematical modelling These principles are applied to the equations in important engineering areas The major disciplines covered are thermodynamics diffusion and mass transfer heat transfer fluid dynamics chemical reactions and automatic control These topics are of particular value to chemical engineers but also are of interest to mechanical civil and environmental engineers as well as applied scientists The material is also suitable for undergraduate and beginning graduate students as well as for review by practising engineers *Books in Print Supplement*, 2002 **Mechanical Engineering**, 1985 *Scientific and Technical Books in Print*, 1972 Scientific and Technical Books and Serials in Print, 1989 **A Method of Fundamental Solutions in Poroelasticity to Model the Stress Field in Geothermal Reservoirs** Matthias Albert Augustin, 2015-07-15 This monograph focuses on the numerical methods needed in the context of developing a reliable simulation tool to promote the use of renewable energy One very promising source of energy is the heat stored in the Earth's crust which is harnessed by so called geothermal facilities Scientists from fields like geology geo engineering geophysics and especially geomathematics are called upon to help make geothermics a reliable and safe energy production method One of the challenges they face involves modeling the mechanical stresses at work in a reservoir The aim of this thesis is to develop a numerical solution scheme by means of which the fluid pressure and rock stresses in a geothermal reservoir can be determined prior to well drilling and during production For this purpose the method should i include poroelastic effects ii provide a means of including thermoelastic effects iii be inexpensive in terms of memory and computational power and iv be flexible with regard to the locations of data points After introducing the basic equations and their relations to more familiar ones the heat equation Stokes equations Cauchy Navier equation the method of fundamental solutions and its potential value concerning our task are discussed Based on the properties of the fundamental solutions theoretical results are established and numerical examples of stress field simulations are presented to assess the method's performance The first ever 3D graphics calculated for these topics which neither requiring meshing of the domain nor involving a time stepping scheme
