4. Is this a diagram of a generator or a motor?

generator

Directions: Circle the term in parentheses that makes each statement true.

- When the wire loop of a (motor, generator) turns, an electric current is produced.
- The current produced by a generator is (direct, alternating) current.
- A motor (uses, creates) an electric current as it turns.
- A device that increases or decreases voltage of electric current passing through a power line is a (transformer, motor).
- If the secondary coil of a transformer has more turns than the primary coil, the transformer is a (step-up, step-down) transformer.

Directions: In the space below, draw a sketch of a step-down transformer that has half as many coils in the secondary coil as in its primary coil. Label the two coils.

Smart Robust Operation and Trading of Integrated Energy Systems with Low Pollution Goals Kaiping Qu, Yue Zhou, Xin Fang, Shuli Wen, Shiwei Xie, 2024-09-23 To mitigate two major environmental concerns of global warming and air pollution renewable energies with uncertainty are increasingly deployed in power systems which challenge the system's secure operation. A single system usually has limited adjusting ability. In contrast, integrated energy systems such as electricity, gas, electricity, traffic, electricity, heat, and transmission distribution coordinated systems enhance the regulating ability of renewable energy accommodation and environmental protection. The operation of integrated energy systems will meet three essential requirements: low pollution, attribute robustness, and cooperativity. However, the diversity of uncertainty conditions, the complementarity of new energy accommodation among systems, the conflict of interest between systems, and the dispatch autonomy of systems challenge the requirements mentioned above. The main goal of this Research Topic includes: 1. Propose more effective trading mechanisms or control strategies for carbon and air pollutant emissions; 2. Fully use complementary effects between electric power, natural gas, heat, hydrogen, and traffic systems; 3. Realize the coordinated operation of integrated energy systems with limited information interaction and ensured dispatch autonomy; 4. Improve the robustness of integrated energy systems under diversified uncertainty conditions; 5. Apply data-based reinforcement learning methods for the dynamic decision of smart integrated energy systems under complex environments.

The Nickajack Project Tennessee Valley Authority, 1972 Nickajack Dam was built by TVA in the mid 1960s at Tennessee River mile 424.7 to replace the old and leaking Hales Bar Dam located 6.4 miles upstream. The Nickajack site is located in Marion County, Tennessee, 18 air miles west of Chattanooga and about 2 miles northwest of the junction of the Alabama-Georgia-Tennessee State lines. Historically, the ancient Indian town of Nickajack was located at Shellmound, about a mile and a half upstream from the dam on the left bank of the reservoir. Nickajack was inhabited by the Cherokees as early as 1730. In 1784, the warlike Chief Dragging Canoe, who had earlier broken with the Cherokees, launched his marauding Chickamaugas from the town and used the nearby Nickajack Cave as a hideout. Later during the Civil War, saltpeter was mined in the cave for Confederate gunpowder.

Renewable Energy in Power Systems Leon Freris, David Infield, 2008-09-15 Renewable Energy RE sources differ from conventional sources in that generally they cannot be scheduled; they are much smaller than conventional power stations and are often connected to the electricity distribution system rather than the transmission system. The integration of such time-variable distributed or embedded sources into electricity networks requires special

consideration This new book addresses these special issues and covers the following The characteristics of conventional and RE generators with particular reference to the variable nature of RE from wind solar small hydro and marine sources over time scales ranging from seconds to months The power balance and frequency stability in a network with increasing inputs from variable sources and the technical and economic implications of increased penetration from such sources with special reference to demand side management The conversion of energy into electricity from RE sources and the type and characteristics of generators used The requirement to condition the power from RE sources and the type and mode of operation of the power electronic converters used to interface such generators to the grid The flow of power over networks supplied from conventional plus RE sources with particular reference to voltage control and protection The economics and trading of green electricity in national and international deregulated markets The expected developments in RE technology and the future shape of power systems where the penetration from RE sources is large and where substantial operational and control benefits will be derived from extensive use of power electronic interfaces and controllers The text is designed to be intelligible to readers who have little previous knowledge of electrical engineering The more analytical electrical aspects are relegated to an Appendix for readers who wish to gain a more in depth understanding The book s flexible structure makes its accessible to the general engineer or scientists but also caters for readers with a non scientific background Economists planners and environmental specialists will find parts of the book informative *Drawings for the Cherokee Project ,1947*
