

PROTEIN SYNTHESIS

TRANSLATION

1. Translation is the process by which the genetic code is used to synthesize a protein. It occurs in the cytoplasm of the cell, where the mRNA is translated by ribosomes. The ribosome is composed of two subunits, a large subunit and a small subunit. The large subunit contains the ribosomal RNA (rRNA) and the small subunit contains the ribosomal protein (rP).

2. During translation, the ribosome moves along the mRNA strand, reading the codons and adding amino acids to the growing polypeptide chain. The amino acids are brought to the ribosome by transfer RNA (tRNA) molecules. Each tRNA has an anticodon that pairs with the mRNA codon. The amino acid is then transferred to the growing chain, and the tRNA is released. This process continues until the ribosome reaches a stop codon, at which point the protein is released.

THE GENETIC CODE

"One codon at a time"

1. Biological systems use sequences of three nucleotides to specify the amino acids that are used to build proteins. These sequences are called codons. Each codon specifies a particular amino acid, and the sequence of codons in a gene determines the sequence of amino acids in a protein.

2. Experiments during the 1960s demonstrated that the genetic code is a triplet code. This means that each amino acid is specified by a sequence of three nucleotides. The sequence of nucleotides in a gene is called the genetic code, and the sequence of amino acids in a protein is called the primary structure of the protein.

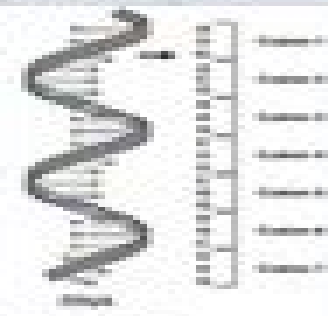

3. The genetic code is universal, meaning that it is the same in all organisms. This is because all organisms use the same set of amino acids to build proteins.

"One gene - one protein"

1. One gene codes for one protein. This means that the sequence of nucleotides in a gene determines the sequence of amino acids in a protein. The sequence of amino acids in a protein determines its function.

2. The genetic code is a triplet code, meaning that each amino acid is specified by a sequence of three nucleotides. The sequence of nucleotides in a gene is called the genetic code, and the sequence of amino acids in a protein is called the primary structure of the protein.
