

## Genetics Problems

1. Suppose a father of blood type A and a mother of blood type B have a child of type O. What are the possible blood types of the mother and father?

Father:  $I^A I^i$  Mother:  $I^B I^i$

2. Suppose a father of blood type B and a mother of blood type O have a child of type O. What are the chances that their next child will be blood type O? Type B? Type A? Type AB?

type O: 50% or  $\frac{1}{2}$

Type B: 50% or  $\frac{1}{2}$

Type A: 0%

Type AB: 0%

1

3. Why is blood type inheritance an example of both codominance and complete dominance?

Alleles A and B are codominant – they are expressed equally (at the same time) when present in a cell (genotype  $I^A I^B$ ), but both alleles A and B are dominant over allele O, when present in the heterozygous genotype ( $I^A I^i$  or  $I^B I^i$ )

4. Sickle-cell anemia is a condition in which the red blood cells of an individual can become shaped like the letter “C.” This shape prevents the red blood cells from moving easily through blood vessels. It can result in the cells clumping, blocking blood flow and causing pain, infection, and organ damage. The allele that causes sickle-cell anemia is autosomal recessive ( $s$ ), and the dominant allele can be represented by  $S$ .

(a) For the following families, determine the genotypes of the parents and offspring. When it is not possible to decide which genotype an individual is, list both.

(i) Two normal parents have four normal children and one with sickle-cell anemia.

Parents both  $Ss$

normal children: either  $Ss$  or  $SS$

child with sickle cell anemia:  $ss$

(ii) A normal male and a female with sickle-cell anemia have six children, all normal.

normal male: most likely  $SS$ , but could be  $Ss$  (sample size is too small to tell for sure);

female:  $ss$

6 normal offspring:  $Ss$

(iii) A normal male and a female with sickle-cell anemia have six children; three are normal, and three have sickle-cell anemia.

Normal male:  $Ss$

female with sickle cell anemia:  $ss$

3 normal children:  $Ss$

3 children with sickle cell anemia:  $ss$

(b) Construct a pedigree chart for the families in (ii) and (iii).

Essential Genetics, **Biologic and Gene Therapy of Autoimmune Disease** C. Garrison Fathman, 2000-01-01. The clinical management of autoimmune diseases has proven to be extremely difficult. Current therapies focus on trying to alleviate symptoms but fail to correct the fundamental immune defects that lead to pathology. To achieve this goal it is necessary to understand much of the biology of antigen presentation, lymphocyte activation and the effects of cytokines. The articles in this book provide an up to date review of current innovative therapies using both biologic and gene therapy for the treatment of selected autoimmune diseases. Therapeutical approaches discussed include oral tolerance, the use of anti CD4 monoclonal antibodies, IL 10 and anti TNF $\alpha$  antibodies, DNA vaccination and gene therapy applied to organ specific autoimmune disease. Although some of these techniques are still in their infancy, their potential efficacy has been demonstrated in several animal models of autoimmune disease, holding great promise for the future development of treatments. Written by recognized experts in the field, the chapters in this book illustrate the concept of technology transfer from bench to bedside and provide a valuable update for clinicians and scientists in clinical immunology. **Cumulated Index Medicus**, 1996 **Abeloff's Clinical Oncology E-Book** Martin D.
