

14.3 Studying the Human Genome

Learning Objectives

LO 14.3.1 Explain how DNA sequencing led to the development of recombinant DNA technology, which is the process of joining DNA from different sources to create new genetic combinations (LO 14.3.1.1)

- Describe recombinant DNA technology, which is the process of joining DNA from different sources to create new genetic combinations.
- Explain how recombinant DNA technology is used to create transgenic organisms, which are organisms that have been genetically modified to contain DNA from another species.
- Explain how recombinant DNA technology is used to create gene therapy, which is the process of replacing a defective gene with a normal one.

The **Human Genome Project** was a large international effort to sequence all the genes in the human genome. The project was completed in 2003.

- They used "shotgun sequencing" to break the genome into small fragments, which were then sequenced individually.
- The Human Genome Project's findings have led to many discoveries, including the identification of the human genome, the discovery of new genes, and the development of new drugs.
- The Human Genome Project's findings have also led to the development of new diagnostic tests, such as those used to identify people with certain genetic disorders.
