

## 1. Physics Notes

### - Chapter 2

- 2.2: Speed is a measure of how fast something is moving. It is the rate which distance is covered.
  - The word rate is a clue that something is being divided by time. Speed is always measured in terms of a unit of distance divided by a unit of time.
  - Instantaneous Speed: A speed at any instant.
  - $Average\ speed = \frac{(Total\ distance\ covered)}{(Time\ Interval)}$
- 2.3
  - Velocity:
    - The difference between speed and velocity is velocity has a direction.
  - Constant Velocity
    - From the definition of velocity, it follows that to have a constant velocity requires both constant speed and constant direction. Constant speed means that the motion remains at the same speed.
    - Motion at constant velocity is motion in a straight line at constant speed.
  - Changing velocity
    - If either the speed or the direction is changing, then the velocity is changing. Constant speed and constant velocity are not the same.
    - In a car there are three controls that are used to change the velocity. Gas, break, steering.
- 2.4 Acceleration:
  - $Acceleration = \frac{(change\ of\ velocity)}{(Time\ interval)}$
  - The rate at which the velocity is changing is called acceleration. Because acceleration is a rate, it is a measure of how the velocity is changing with respect to time.
  - What defines acceleration is change.
  - Acceleration applies to decreases as well as increases in speed.
  - This is often called deceleration, or negative acceleration.
  - Acceleration, like velocity is directional. If we change either speed or direction, or both. We change velocity. And we accelerate.
  - When straight-line motion is considered, it is common to use speed and velocity interchangeably.
  - $Acceleration\ (along\ a\ straight\ line) = \frac{change\ in\ speed}{time\ interval}$
  - Speed and velocity are measured in units of distance per time.
- 2.5 Free Fall, How Fast:
  - Starts from a rest position and gains speed as it falls
