*Intelligent Systems, Business, and Innovation Research* Rim El Khoury, Nohade Nasrallah, 2024-01-25 Intelligent systems research is a multidisciplinary field that focuses on the development of systems that can perceive reason and act autonomously This can include areas such as machine learning artificial intelligence natural language processing and robotics The goal of intelligent systems research is to develop systems that can understand learn from and adapt to their environment to perform tasks that would typically require human intelligence Business and innovation research is an interdisciplinary field that examines how organizations can create develop and implement new ideas products and services This can include areas such as organizational behaviour strategic management and marketing The goal of business and innovation research is to understand how organizations can foster an environment that encourages creativity and innovation and how they can develop and implement new ideas in a way that leads to success Intelligent Systems Business and Innovation Research is a research area that brings together these two fields to study the use of intelligent systems and technologies in the business context to drive innovation improve operational

efficiency and effectiveness of the organization. The book aims to understand how intelligent systems can be used in business applications how to design and implement them how to manage the associated challenges and how to leverage them to foster innovation create new business models and gain competitive advantage. It offers guidance on how to navigate potential conflicts and challenges that may arise during multidisciplinary research in areas such as Industry 4.0 Internet of Things modern machine learning software agent applications and data science. The book focuses on the various fields in which intelligent systems play a critical role in enabling the development of advanced technologies that can perform tasks that would typically require human intelligence. For example in smart control systems intelligent algorithms can be used to optimize the performance of machines and devices while in cyber security they can be used to protect networks and data from cyber attacks. In bioinformatics intelligent systems can be used to analyse large amounts of biological data while in virtual reality and robotics they can be used to create realistic and responsive simulations and automatons. Additionally the book also highlights the rapidly advancing theoretical foundations of fuzzy sets mathematical logic and non classical logic. These are important theoretical frameworks for the development of intelligent systems as they provide the foundation for the representation and manipulation of uncertainty complexity and imprecision. These theoretical foundations are essential in the development of intelligent systems that can make decisions and perform tasks in uncertain complex and dynamic environments.

Modeling techniques and control strategies for inverter dominated microgrids Gkountaras, Aris, 2017-02-15  
The character of modern power systems is changing rapidly and inverters are taking over a considerable part of the energy generation. A future purely inverter based grid could be a viable solution if its technical feasibility can be first validated. The focus of this work lies on inverter dominated microgrids which are also mentioned as hybrid in several instances throughout the thesis. Hybrid as far as the energy input of each generator is concerned. Conventional fossil fuel based generators are connected in parallel to renewable energy sources as well as battery systems. The main contributions of this work comprise of The analysis of detailed models and control structures of grid inverters synchronous generators and battery packs and the utilization of these models to formulate control strategies for distributed generators. The developed strategies accomplish objectives in a wide time scale from maintaining stability during faults and synchronization transients as well as optimizing load flow through communication free distributed control. Die Struktur der modernen Energieversorgung hat sich in den letzten Jahrzehnten massiv geändert. Dezentrale Generatoren die auf Wechselrichtern basieren bernehmen einen großen Teil der Energieerzeugung. Ein ausschließlich wechselrichterbasiertes Netz wäre ein realistischer Ansatz wenn seine technische Machbarkeit verifiziert werden könnte. Die wichtigste Beiträge dieser Arbeit sind Die Analyse von Modellen und Regelstrukturen von Netzwechselrichtern Synchrongeneratoren und Batterieanlagen. Die entwickelten Modelle werden verwendet um Regelstrategien für dezentrale Generatoren in Mittelspannungsinselnetzen zu formulieren. Die erste Strategie ist eine Synchronisationsmethode für netzbildende Wechselrichter. Zweitens wird die Leistungsaufteilung in

Mittelspannungsinselnetzen mittels Droop Regelung analysiert Weiterhin erfolgt die Untersuchung der transienten Lastaufteilung zwischen netzbildenden Einheiten mit unterschiedlichen Zeitkonstanten Beim Betrieb mehrerer paralleler Wechselrichter wird der Einfluss der Netzimpedanz auf die transiente Lastaufteilung analysiert Die dritte entworfene Regelstrategie umfasst die Integration der Sekundärregelung in die Primärregelung Der Ladezustand von Batterien wird mit der Lastaufteilung gekoppelt um die Autonomie des Netzes zu stärken Abschließend wird eine Kurzschlussstrategie für netzbildende und netzspeisende Wechselrichter entwickelt Ziel der Strategie ist die Maximierung des Kurzschlussstromes Als zusätzliche Randbedingung soll keine Kommunikation zwischen Generatoren stattfinden
