Maxwell, Shohreh B. Eckhardt, 2012-12-06 This treatise had its origins in the authors strong opinion that the discovery of new drugs especially of innovative therapeutic agents really does not happen as a spontaneous sequel to investigative research no matter how penetrating such research may be Rather it seemed to us that the discovery of innovative therapeutic agents was a very active process existing in and of itself and demanding full attention it was not simply a passive dependent by process of

investigative research And yet many researchers some close confreres of the authors others more distant believed otherwise We felt that their view reflected unrealistic thinking and that reality probably lay closer to what Beyer maintained We are taught to believe that if we can understand a disease it should be easy enough to figure out say the molecular configuration of a definitive receptor mechanism somewhere along the line and to design a specific drug And so we start out to understand the disease but never get around to doing much about therapy The authors very soon realized that there was essentially no quantitative information available on just where and how innovative therapeutic agents were discovered There were only anecdotal accounts and these were able to be selected and presented in ways that could be used to defend any point of view

Behavioral Medicine with the Developmentally Disabled J.H. Kedesdy, D.C. Russo, 2013-11-11 Since the late 1960s the behavioral treatment of mentally retarded autistic and other developmentally disabled persons has grown progressively more sophisticated The literature on behavioral treatment has produced effective and clinically significant programs for the reduction of maladaptive behaviors such as tantrums aggression and self injury skills deficits have been remediated through improved programs for language and life skills acquisition and new environments have been opened in the creation of mainstream educational opportunities In spite of these advances it strikes us that this almost exclusive focus on behavior problems and skills remediation has been somewhat myopic and that much of the potential for application of behavioral science to solving problems of the developmentally disabled is as yet untapped In the 1980s an important revolution has taken place the development of the field of behavioral medicine This field in merging disease treatment and management with learning and behavior has already made impressive progress toward a reconceptualization of health care that acknowledges the centrality of behavior in disease expression Although there has as yet been only a preliminary application of this reconceptualization to the field of developmental disabilities we are convinced that further extension has great potential

Stress and Hypertension Kevin T. Larkin, 2008-10-01 Does living a stress filled life lead to elevated blood pressure And if so do strategies to better manage stress effectively lower blood pressure In this authoritative and comprehensive book Kevin T Larkin examines more than a half century of empirical evidence obtained to test the common assumption that stress is associated with the onset and maintenance of essential hypertension high blood pressure While the research confirms that stress does play a role in the exacerbation of essential hypertension numerous other factors must also be considered among them obesity exercise and smoking as well as demographic constitutional and psychological concerns The author discusses the effectiveness of strategies developed to manage stress and thereby lower blood pressure and concludes with suggestions and directions for further study

sciences and statistics **The Psychology and Physiology of Breathing** Robert Fried, 2013-06-29 This is Robert Fried's third book on the crucial role of breathing and hyperventilation in our emotional and physical health. The first, *The Hyperventilation Syndrome* 1987, was a scholarly monograph and the second, *The Breath Connection* 1990a, was a popular version for the lay reader. This book combines the best features of both and extends Dr. Fried's seminal work to protocols for clinical psychophysiology and psychiatry. Hoping to avoid misunderstanding, he has taken systematic care to introduce relevant electrical, physiological, and psychological concepts in operational language for the widest possible professional audience. Any clinician not thoroughly experienced in respiratory psychophysiology and biofeedback will leave these pages with profound new insight and direction into an aspect of our lives which we innocently take for granted as common sense: the role of breathing in health and illness. Einstein viewed such common sense as that set of prejudices we acquired prior to the age of eighteen. I am impressed that Dr. Fried mirrors Einstein's uncanny genius in not accepting the obvious: breathing is not common sense but rather is a pivotal psychophysiological mechanism underlying all aspects of life.
