

STANDARD SPOOL OPERATION

The standard speed is used in conjunction with a non-return valve to operate a service where back-pressure in the service line will occur due to a gravity loading opposing the action of the ram.

Example:

In the upper illustration the slower ram speed is being selected but, due to the loaded bucket **AC**, the back-pressure in the ram feed line is greater than the pump output pressure in the parallel gallery at **B**. This higher pressure causes the non-return valve **C** to remain closed, preventing the possibility of reverse oil flow which would allow the load to drop.

When the speed is fully selected, the neutral circuit **DE** is completely cut off and the pressure rise in the parallel gallery **B** until it exceeds that in the ram feed line. At this point the non-return valve **C** opens, permitting oil to flow to the ram and to raise the load.

The use of non-return valves also prevents interference between speeds. For example, if non-return valves were not fitted and two loads were being raised simultaneously, the heavier of the two loads would fall and oil from that ram would flow to the more lightly loaded ram and increase its lifting speed. With non-return valves in the system however, the oil is prevented from flowing from one service to another.
