

Hydraulic and Electrical Operation

Oil from the pump B is fed through an internal passage via the filter to pressure maintenance valve D, which maintains pressure to the solenoid valve E for clutch selection. Excess oil from the maintenance valve flows

back through the casing to the torque converter S. Oil enters the converter between the converter hub and the stator support, and leaves between the Reverser Shaft and Pump Drive Shaft. Pressure in the converter is controlled by a regulating valve C which dumps oil from the converter line back to the sump.
