Compiler Construction Hanspeter Mössenböck, 2025-04-29 This textbook covers the fundamentals of compiler construction from lexical analysis and syntax analysis to semantic processing and code generation As a running example a compiler for a simple Java like programming language MicroJava is described and developed It generates executable bytecode similar to Java bytecode Other topics include the description of translation processes using attributed grammars and the use of a compiler generator to automatically generate the core parts of a compiler For syntax analysis the book concentrates on top down parsing using recursive descent but also describes bottom up parsing All code examples are presented in Java A companion web page contains a full set of PowerPoint slides for an introductory compiler course sample solutions for more than 70 exercises provided at the end of each chapter to practice and reinforce the content of that chapter and the full source code of the MicroJava compiler as well as other code samples In addition the open source compiler generator Coco R described in the book is provided as an executable and in source code The book targets both students of Computer Science or related fields as well as practitioners who want to apply basic compiling techniques in their daily work e g when crafting software tools It can be used as a textbook for an introductory compiler course on which more advanced courses on compiler optimizations can be based *The Bulletin of Mathematics Books*, 1992 **ACM SIGPLAN Notices**, 2006-07 **Modern Compiler Implementation in Java** Andrew W. Appel, 1998 Last year you may have seen the Modern Compiler Implementation in C Basic Techniques 1997 which was the preliminary edition of our new 1998 textbook Modern Compiler Implementation in C The new expanded version of this textbook describes all phases of a modern compiler lexical analysis parsing abstract syntax semantic actions intermediate representations instruction selection via tree matching dataflow analysis graph coloring register allocation and runtime systems It includes good coverage of current techniques in code generation and register allocation as well as functional and object oriented languages that are missing from most books In addition more advanced chapters are now included so that it can be used as the basis for two semester or graduate course The most accepted and successful techniques are described in a concise way rather than as an exhaustive catalog of every possible variant Detailed descriptions of the interfaces between modules of a compiler are illustrated with actual C header files The first part of the book Fundamentals of Compilation is suitable for a one semester first course in compiler design The second part Advanced Topics which includes the advanced chapters covers the compilation of object oriented and functional languages garbage collection loop optimizations SSA form loop scheduling and optimization for cache memory hierarchies A unique feature of the book is a well designed compiler implementation project in Java including front end and high tech back end phases so that students can build a complete working compiler in one semester Accompanying support software is available *Modern Compiler Implementation in Java: Basic Techniques* Andrew W.
