CONFIGURATION

The VMAX 40K array configurations are designed for extensive storage environments. The array configurations include at least one system bay that can house from one to eight engines, and a number of half or full populated storage bays, depending on the number of engines in the array. Angled into the one full engineering unit that houses control, CPU power, network (host) and redundant connectivity to other in the array.

The maximum array configuration also depends on the type of drive array architecture desired. If one 15-bay standard drive bay is used, the maximum array configuration includes an eight-bay system bay and 14 storage bays. If four 15-bay drive bays are configured, the maximum configuration consists of a system bay and 14 drive bays. Both bay types can be used within the array but not within the same storage bay.

Each bay contains storage bays and associated control bays connected to a dedicated engine in the system bay. Depending on the size the bays connect to the engine, they are referred to as sub-engine or sub-engine CAGs.

System bay operates as an array management control interface for arrays with three or more engines. The second, physically separated system bay is used when a third (three 15, 15x three 21, or seven 21) is added to the array. This engine and its subsequent engines are added to the second system bay. The designated system bay placement is suitable for data centers that cannot accommodate large, contiguous array placements. The maximum distance between both system bays is 20 km (12.1 mi).
