

Environmental Science: Ecology

What is environmental science? Is it the way nature plays a role on earth? How about the way around 100 billion animals, fungi, plants, and bacteria live all together on one planet? Or it could be about the soil, water, the mountains, and the wind. Those are all parts of environmental science but, there is a lot more to it. Environmental science is the field of science that studies the interactions of the physical, chemical, and biological components of the environment, the relationships and the effects of these components with the organisms in the environment. Humans have been using environmental products past the 1600s. We began to look more into the science of nature and how humans many alterations of the planet have taken a toll on this planet. Today, in the 21st century, humans are still pinpointing, observing, using trial and error, and constantly collecting data to help us express information to almost 8 billion people on this earth on why environmental science is so important.

What is Ecology? Ecology is a branch of environmental science that investigates the relationships between the environment of an organism and how they interact with one another. Ecology is then broken into smaller studies as well. A study on an individual species would be labeled as autecology and the study of groups of organisms is classified as gynecology. These individual studies expanded from studying bacteria to mushrooms. Each scientist soon became classified by a name, for instance, a scientist who studies plants would be classified as a botanist, ones who study birds are an ornithologist, rocks are a geologist, water is hydrometeorology, insects are entomologists, etc. Ecology is more spoken out to be a new study, dating back to only the 20th century. Nonetheless, the general ideas of ecology have been around for a long time. The ecological thinking developed gradually throughout the millennia and had many connections with other environmental situations and biological disciplines. With, the actual first man to have opened the general idea of ecology may be Aristotle.

It was in the BC era where Aristotle (384-322), an ancient Greek environmental philosopher and scientist who studied the weather, was the starting branch of weather forecasting. Following his studies, a book of weather forecasting came out, "The Book of Sigma", and following that many other natural philosophers and scientist continued to expand their studies on weather conditions of the atmosphere using many types of instruments, maps, and charts. The natural phenomenon was a direct study that became important to many scientists today. Aristotle and Theophrastus (one of his students) also had a fascination with many species of animals, plants and their interrelationships. Environmental philosophers are concerned with the natural environment and the humans placed within it. They look more in-depth with questions such as, " what is the value of the natural, non-human environme
