Development of a Demand Defrost Controller. Final Report, 1993 The purpose of this project was to develop and commercialize a demand defrost controller that initiates defrosts of refrigeration systems only when required The standard method of control is a time clock that usually defrosts too often which wastes energy The controller developed by this project uses an algorithm based on the temperature difference between the discharge and return of the display case air curtain along with several time settings to defrost only when needed This controller was field tested in a supermarket where it controlled defrost of the low temperature display cases According to test results the controller could reduce annual energy consumption by 20 000 and 62 000 kWh for hot gas and electric defrost respectively The controller saves electric demand as well as energy is adaptable to ambient air conditions and provides valuable savings throughout the year The savings are greatest for low temperature systems that use the most energy A less tangible benefit of the demand controller is the

improvement in food quality that results from fewer defrosts
