

Regulator Operation

When the generating voltage increases higher than the set voltage of zener diode ZD, the current from the alternator flows through the zener diode to base B for transistor T2, connecting collector C to emitter E. Accordingly, the current flowing through base B for transistor T1 is cut so that transistor T1 is turned OFF. Thereby, the current flowing through field coil FC is cut, causing the SC generating voltage to decrease.

Then, when the voltage to be applied to zener diode ZD becomes lower than the set voltage of zener diode ZD, transistor T2 is turned OFF, turning transistor T1 ON again. Thus, the current is allowed to flow through field coil FC to increase the generating voltage by stator coil SC. As this operation is repeated, the alternator generating voltage is maintained at the specified level.
