

ENDOCRINE SYSTEM

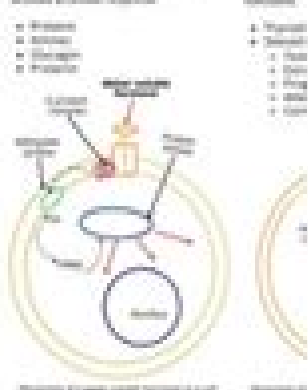

Hormones Chemical substances that act as messengers and control metabolic functions of other cells in the body.

- They are 7-10% of the body's mass.
- Are classified as **steroid** or **protein** hormones.
- Protein hormones, acting through receptors on the cell membrane, produce a response in the cell.
- Steroid hormones, acting through receptors in the cell, produce a response in the cell.
- Protein hormones, acting through receptors on the cell membrane, produce a response in the cell.
- Steroid hormones, acting through receptors in the cell, produce a response in the cell.

Water vs. Lipid Soluble Hormones

Water soluble hormones bind to a receptor on the plasma membrane, producing a response. It produces a regulatory molecule that is released in the blood and acts on a target cell to produce a response.

Lipid soluble hormones bind to a receptor inside the cell, producing a response. It produces a regulatory molecule that is released in the blood and acts on a target cell to produce a response.

Endocrinology the scientific study of hormones and the endocrine glands.

- 1. Growth and development
- 2. Metabolic rate, electrolyte and water balance
- 3. Reproductive function and energy balance
- 4. Homeostasis

How it works: The endocrine system works with the nervous system to control and regulate various functions in the body, such as metabolism, growth, and reproduction.

- 1. Hormones are released by endocrine glands into the bloodstream.
- 2. Each hormone has a specific function in the body and binds to a specific receptor on the target cell.
- 3. Each hormone specifically binds to a **target cell**.
- 4. A target cell has receptors on their cell membrane designed to respond to that specific hormone.
- 5. When the hormone binds to its receptor, the receptor sends a signal to the cell's nucleus, which then produces a response.
- 6. After the hormone binds to the cell receptor, a chemical chain of events occurs, leading to a hormonal response.

Effectors are cells, organs or glands that respond to hormones, producing a response.

ENDOCRINE VS. EXOCRINE GLANDS

Endocrine glands release hormones into the bloodstream. **Exocrine glands** release substances into a duct, which then carries them to the target site.

REPRODUCTIVE SYSTEM

The **reproductive system** functions to produce offspring. Primarily sex organs called **gonads** (ovaries in females and testes in males) produce sex cells and sex hormones. Accessory organs include ducts, glands, and external genitalia.

Two categories include the **male reproductive system** which produces **sperm**, and the **female reproductive system** which produces **eggs**.

Male Phase Male produces sex cells (sperm) and sex hormones (testosterone). Sperm enters the urethra and travels into the vagina through the cervix, where it can fertilize an egg.
