Magnetic Bubble Technology A. H. Eschenfelder,2012-12-06 Magnetic bubbles are of interest to engineers because their properties can be used for important practical electronic devices and they are of interest to physicists because their properties are manifestations of intriguing physical principles At the same time the fabrication of useful configurations challenges the materials scientists and engineers A technology of magnetic bubbles has developed to the point where commercial products are being marketed In addition new discovery and development are driving this technology toward substantially lower costs and presumably broader application For all of these reasons there is a need to educate newcomers to this field in universities and in industry The purpose of this book is to provide a text for a one semester course that can be taught under headings of Solid State Physics Materials Science Computer Technology or Integrated Electronics It is expected that the student of anyone of these disciplines will be interested in each of the chapters of this book to some degree but may concentrate on some more than others depending on the discipline At the end of each chapter there is a brief summary which will serve as a reminder of the contents of the chapter but can also be read ahead of time to determine the depth of your interest in the chapter **The Characterization of Linear Polyethylene SRM 1475** Herman L. 1989 It includes the Stewartson Memorial Lecture of Professor J H Whitelaw and is divided into three parts The first is a collection of papers that describe the status of current technology in two and three dimensional steady flows the second deals with two and three dimensional unsteady flows and the papers in the third address stability and transition Each of the three parts begins with an overview of current research as described in the following chapters The individual papers are edited versions of the selected papers originally submitted to the symposium Four years have passed since the Third Symposium and certain trends become clear if one compares the papers contained in this volume with those of previous volumes There are more three than two dimensional problems considered in Part 1 and the latter address more difficult problems than in the past for example the extension to higher angles of attack to transonic flow to leading edge ice accretion and to thick hydrofoils The large number of papers in the first part reflects the emphasis of current research and development and the needs of industry
