Trends in Neuroimmunology: cross-talk between brain-resident and peripheral immune cells in both health and disease
Estela Maris Muñoz,Rajnikant Mishra ,Veronica Martinez Cerdeño,Janina Edith Borgonovo,Shashank Kumar Maurya ,Suryanarayan Biswal,2024-06-26 The functional anatomy of organisms is maintained by the coordination of different systems that often rely on particular interactions between specialized cells and between macromolecules The immune system works with the circulatory and the lymphatic systems to protect most of the organs However some organs are considered immune privileged due to the presence of highly selective and regulated barriers such as the blood brain barrier BBB within the brain The BBB controls periphery brain molecule exchange and prevents immune effector cells from entering the homeostatic brain BBB associated elements such as endothelial cells pericytes astrocytes and microglia potentially can function as antigen presenting cells APC Pathological scenarios that induce dysfunction of the BBB and its associated cells may lead to the infiltration of lymphocytes crossing over from the blood to brain Similarly traumas can also enable B and T lymphocytes to pass bidirectionally between the CNS and the periphery via the meningeal lymphatic vessels which drain into the cervical lymph nodes Research in animals and in humans has revealed that B and T cells are involved in the progression of neurological diseases It has been showed that under particular conditions T cells establish themselves and become resident in the brain T RM cells from where they can either exert beneficial or detrimental effects on brain function Amazing efforts have been made to further comprehend interactions between brain specific cells and peripheral immune cells and especially their roles and impact on the onset progression and eventual resolution of diverse brain pathologies *Interaction between the Gut Flora and Immunity in Intestinal Diseases* Yating Li,Silvia Turrone,Lan Gong,Ding Shi,2024-08-20 The composition of gut microbiota plays a critical role in maintaining the host s health particularly in regulating immune homeostasis and the intestinal immune response A massive effort has pointed to the importance of these interactions in various intestinal diseases like colorectal cancer CRC irritable bowel syndrome IBS and inflammatory bowel disease IBD Microbiome influences the formation of key components of both the innate and adaptive immune systems while the immune system is responsible for regulating and maintaining the symbiotic relationship between the host and microbes Currently the crosstalk between gut flora and host immunity is not fully revealed in both homeostasis maintenance and disease development Hence detailed mechanistic studies are needed to further explore the microbial manipulation on host immunity as well as the immune response to microbiome dysbiosis in intestinal diseases Current evidence indicates a strong bidirectional interaction between microbiome perturbation and immune dysregulation The aim of this Research Topic is to create a platform for the advancement of research on the causal relationship between the microbiome and immunity Besides we would like to define the core microbiota responsible for the initiation and progression of intestinal diseases the molecular mechanisms of host immune microbiome interactions and novel gut targeted pharmacological interventions to achieve a positive impact on

An Epidemic of Absence Moises Velasquez-Manoff, 2012-09-04 Whether it is asthma food or pollen allergies type 1 diabetes lupus multiple sclerosis or Crohn's disease everyone knows someone who suffers from an allergic or autoimmune disorder And if it appears that the prevalence of these maladies has increased recently that's because it has to levels never before seen in human history These days no fewer than one in five and likely more Americans suffer from one of these ailments We seem newly and bafflingly vulnerable to immune system malfunction Why Science writer Moises Velasquez Manoff explains the latest thinking about this problem and explores the remarkable new treatments in the works In the past 150 years improved sanitation water treatment and the advent of vaccines and antibiotics have saved countless lives nearly eradicating diseases that had plagued humanity for millennia But now a growing body of evidence suggests that the very steps we took to combat infections also eliminated organisms that kept our bodies in balance The idea that we have systematically cleaned ourselves to illness challenges deeply entrenched notions about the value of societal hygiene and the harmful nature of microbes Yet scientists investigating the rampant immune dysfunction in the developed world have inevitably arrived at this conclusion To address this global epidemic of absence they must restore the human ecosystem
