Modelling Potential Crop Growth Processes J. Goudriaan, H.H. Van Laar, 2012-12-06 We dedicate this book to professor C T de Wit 1924 1993 who initiated Production Ecology as a school of thought at the Wageningen Agricultural University see Rabbinge et al 1990 To acknowledge the leading role of C T de Wit a recently formed graduate school at this university in Production Ecology was named after him Production Ecology is the study of ecological processes with special attention to flows of energy and matter as factors that determine the productivity of ecological systems Agro ecosystems are a special case of ecosystems which are much better suited for the productivity approach than natural ecosystems are This is the reason for the strong role of agricultural research in production ecology On the other hand it must be recognized that the spatial heterogeneity of natural ecosystems and their species richness may alter some ecophysiological relationships However the basic physical chemical and physiological processes will be the same De Wit introduced the state variable approach as the basis for simulation modelling In this approach the floating character of nature is schematized into a series of snapshots over time in which the states are frozen at each separate moment The current state determines how the rates of change will lead to the next snapshot This way of thinking enables a clear and workable representation of interacting simultaneous processes without compromising on the mathematics
