

3.1 Movement of Substance Across the Plasma Membrane

Structure of the Plasma Membrane

1. S.J. Singer and G. L. Nicolson introduced the fluid-mosaic model of plasma membrane.
 - Proteins are dispersed throughout the phospholipid bilayer.
 - Proteins float about in phospholipid bilayer to form a mosaic pattern that always changes.
 - Plasma membrane present in a flexible, non-static and dynamic state.
2. Plasma membrane composed mainly of phospholipid bilayer and proteins.

Diagram 3.1 Structure of plasma membrane

Characteristics of Plasma Membrane

1. Selectively permeable
 - It only allows certain substances to pass through but not others
2. Dynamic or flexible

Table 3.1 Components of plasma membrane

Components of plasma membrane	Phospholipid bilayer	Transport proteins	
		Carrier protein	Pore protein
Characteristics	A triglyceride	A protein	A protein
Substances that move across the plasma membrane	• Lipid soluble molecules • Non-polar molecules • Small molecules	• Large molecules • Water soluble molecules	• Small molecules • Water soluble molecules or polar molecules

Functions of plasma membrane

1. To control the substances that are entering or leaving the cell
2. To maintain a constant internal environment (homeostasis) of the cell
3. For gaseous exchange
4. To transport nutrients into the cell
5. To excrete waste products out from the cell

comprehensive movement program uses the story of biological evolution as a tool to increase strength flexibility and body awareness Readers learn to unlearn inherited bodily habits by embodying the many forms that life has expressed on Earth from the single cell to the human being and shifting their perception Through this evolutionary movement the body s native intelligence is revived and new movements can be learned enabling the body to overcome chronic musculoskeletal complaints such as lower back shoulder and neck pain and to meet whatever challenges it is faced with [Resources in Education](#) ,2001-10 [The Runes of Evolution](#) Simon Conway Morris,2015-06-30 How did human beings acquire imaginations that can conjure up untrue possibilities How did the Universe become self aware In The Runes of Evolution Simon Conway Morris revitalizes the study of evolution from the perspective of convergence providing us with compelling new evidence to support the mounting scientific view that the history of life is far more predictable than once thought A leading evolutionary biologist at the University of Cambridge Conway Morris came into international prominence for his work on the Cambrian explosion especially fossils of the Burgess Shale and evolutionary convergence which is the process whereby organisms not closely related not monophyletic independently evolve similar traits as a result of having to adapt to similar environments or ecological niches In The Runes of Evolution he illustrates how the ubiquity of convergence hints at an underlying framework whereby many outcomes not least brains and intelligence are virtually guaranteed on any Earth like planet Conway Morris also emphasizes how much of the complexity of advanced biological systems is inherent in microbial forms By casting a wider net The Runes of Evolution explores many neglected evolutionary questions Some are remarkably general Why for example are convergences such as parasitism carnivory and nitrogen fixation in plants concentrated in particular taxonomic hot spots Why do certain groups have a particular propensity to evolve toward particular states Some questions lead to unexpected evolutionary insights If bees sleep as they do do they dream Why is that insect copulating with an orchid Why have sponges evolved a system of fiber optics What do mantis shrimps and submarines have in common If dinosaurs had not gone extinct what would have happened next Will a saber toothed cat ever re evolve Cona Morris observes Even amongst the mammals let alone the entire tree of life humans represent one minute twig of a vast and largely fossilized arborescence Every living species is a linear descendant of an immense string of now vanished ancestors but evolution itself is the very reverse of linear Rather it is endlessly exploratory probing the vast spaces of biological hyperspace Indeed this book is a celebration of how our world is and was populated by a riot of forms a coruscating tapestry of life The Runes of Evolution is the most definitive synthesis of evolutionary convergence to be published to date **Academic Theories of Generation in the Renaissance** Linda Deer Richardson,2018-01-17 This volume deals with philosophically grounded theories of animal generation as found in two different traditions one deriving primarily from Aristotelian natural philosophy and specifically from his Generation of Animals and another deriving from two related medical traditions the Hippocratic and the Galenic The book contains a classification and critique of works that touch

on the history of embryology and animal generation written before 1980 It also contains translations of key sections of the works on which it is focused It looks at two different scholarly communities the physicians *medici* and philosophers *philosophi* that share a set of textual resources and philosophical lineages as well as a shared problem explaining animal generation but that nevertheless have different concerns and commitments The book demonstrates how those working in these two traditions not only shared a common philosophical background in the arts curricula of the universities but were in constant intercourse with each other This book presents a test case of how scholarly communities differentiate themselves from each other through methods of argument empirical investigation and textual interpretations It is all the more interesting because the two communities under investigation have so much in common and yet in the end are distinct in a number of important ways **Science Progress in the Twentieth Century** ,1926 **Science Progress** ,1926

account for sensory perceptual nonconceptual representations Neander draws on insights from state space semantics which appeals to relations of second order similarity between representing and represented domains causal theories of reference which claim the reference relation is a causal one and teleosemantic theories which claim that semantic norms at their simplest depend on functional norms She proposes and defends an intuitive theoretically well motivated but highly controversial thesis sensory perceptual systems have the function to produce inner state changes that are the analogs of as well as caused by their referents Neander shows that the three main elements functions causal information relations and relations of second order similarity complement rather than conflict with each other After developing an argument for teleosemantics by examining the nature of explanation in the mind and brain sciences she develops a theory of mental content and defends it against six main content determinacy challenges to a naturalized semantics
