

Question 1:

Draw the common tangents of the circles and tell how many tangents there are.

Question 2:

If AB is tangent to the circle, find x .

Solution 2:

Since line AB is tangent to the circle, it forms a perpendicular to the radius AC . A right angle triangle is formed. So, we can use Pythagoras's theorem.

$$AB^2 + AC^2 = CB^2$$

Note that the measure of CB is not entirely marked on the figure (we need to account for the radius of the circle that is not marked). So, $CB = (x) + 6$.

$$x^2 + 6^2 = (x+6)^2$$

$$x^2 + 36 = x^2 + 12x + 36$$

Cancel what is common

$$x^2 + 36 = x^2 + 12x + 36$$

$$x^2 + 36 = x^2 + 12x + 36$$

Subtract x^2 on both sides

$$36 = 12x$$

Subtract 36 on both sides

$$x = 3$$

Divide by 12 on both sides

Question 3:

Given that A , B , C are points of tangency, find BC .

Solution 3:

By Tangent-Tangent Congruence Theorem,
 $AC = BC$.

$$2x + 4 = 3x$$

$$x^2 - 3 = x$$

Subtract 4 on both sides by 4

$$x^2 - x - 3 = 0$$

is a quadratic equation

$$x^2 - x - 3 = 0$$

Use formula of 2 terms if $b \neq 0$

$$(x - 2)(x + 1) = 0$$

if $a = 1, b = -1$

$$x = 2 \text{ or } x = -1$$

Since x is a length, it cannot be negative. Therefore, $x = 2$.

$$BC = 3x$$

$$BC = 3(2)$$

$$BC = 6 \text{ units}$$

Question 4:

Is it possible for two tangent lines to the same circle to never intersect? Why or why not?

Solution 4:

Yes. The two tangents of the same circle may never intersect if they are parallel. This happens when they are on opposite ends of the circle.

Geometry: The Line and the Circle Maureen T. Carroll, Elyn

Rykken, 2018-12-20 Geometry The Line and the Circle is an undergraduate text with a strong narrative that is written at the appropriate level of rigor for an upper level survey or axiomatic course in geometry Starting with Euclid's Elements the book connects topics in Euclidean and non Euclidean geometry in an intentional and meaningful way with historical context The line and the circle are the principal characters driving the narrative In every geometry considered which include spherical hyperbolic and taxicab as well as finite affine and projective geometries these two objects are analyzed and highlighted Along the way the reader contemplates fundamental questions such as What is a straight line What does parallel mean What is distance What is area There is a strong focus on axiomatic structures throughout the text While Euclid is a constant inspiration and the Elements is repeatedly revisited with substantial coverage of Books I II III IV and VI non Euclidean geometries are introduced very early to give the reader perspective on questions of axiomatics Rounding out the thorough coverage of axiomatics are concluding chapters on transformations and constructibility The book is compulsively readable with great attention paid to the historical narrative and hundreds of attractive problems *Practical Geometry and*

upon their knowledge as they move from fundamental concepts of circle and triangle geometry to more advanced topics such as isometries and matrices symmetry in the plane and hyperbolic and projective geometry Emphasizing active collaborative learning the text contains numerous fully integrated computer lab activities that visualize difficult geometric concepts and facilitate both small group and whole class discussions Each chapter begins with engaging activities that draw students into the subject matter followed by detailed discussions that solidify the student conjectures made in the activities and exercises that test comprehension of the material Written to support students and instructors in active learning classrooms that incorporate computer technology College Geometry with GeoGebra is an ideal resource for geometry courses for both mathematics and math education majors

Geometry by Its Transformations Christopher Baltus, 2025-02-07 This textbook combines the history of synthetic geometry centered on the years 1800-1855 with a theorem proof exposition of the geometry developed in those years The book starts with the background needed from Euclid's Elements followed by chapters on transformations including dilation similitude homology homogeneous coordinates projective geometry inversion the Möbius transformation and transformation geometry as in French schoolbooks of 1910 Projective geometry is presented by tracing its path through the work of J. V. Poncelet, J. Steiner and K. G. C. von Staudt Extensive exercises are included many from the period studied The prerequisites for approaching this course are knowledge of high school geometry and enthusiasm for mathematical demonstration This textbook is ideal for a college geometry course for self study or as preparation for the study of modern geometry
