

Exponents

An **exponent** is a quick and easy way to show how many times you multiply a number times itself.

The **base** is the number that will be multiplied to itself. The base can be a whole number, a fraction, or sometimes even a decimal, or integer such as a negative number.

The **exponent** is the number of times you multiply the base to itself. The exponent could be any digit. **REMEMBER: YOU NEVER MULTIPLY THE BASE TIMES THE EXPONENT.** $4^2 \neq 4 \times 2$.

There are two ways to read the numbers above. Four to the second power or four squared. Both ways are acceptable. This example: 2^3 is read as two-to-the-third power or two cubed.

A number **squared** means you multiply the base by itself two times. A number **cubed** means to multiply the base by itself three times.

Here are examples:

$5^2 = 5 \times 5 = 25$ The base is 5, the exponent is 2. You multiply the base by itself two times.

$2^3 = 2 \times 2 \times 2 = 8$ This time you multiply the base, which is 2, by itself three times.

$7 \times 7 \times 7 \times 7 = 7^4$ You can also rewrite numbers multiplied to themselves back into an exponent.

Here are a couple of special rules when using exponents: $5^0 = 1$ $5^1 = 5$

A number raised to the power of zero equals 1. If raised to the power of one, it equals itself.

You use exponents in geometry as well. Notice the formulas for the area or volume of a figure:

Area of a Square: S^2 = the length of a side of a square multiplied by itself is the area.

Volume of a Cube: S^3 = the length of a side of a cube multiplied by itself three times is the volume.

Exponents are also very helpful with scientific notation. **Scientific notation** is basically a shortened way of writing long numbers. The number 120,000,000,000,000 is 120 trillion.
