

2.2

Literal Equations and Formulas

2.2 OBJECTIVE

1. Solve a literal equation for a specified variable

Many problems in algebra require the use of **formulas** for their solution. Formulas are simply equations that express a relationship between more than one variable or letter. You are already familiar with a number of examples. For instance,

$$P = R \cdot B \quad A = \frac{1}{2}h \cdot b \quad P = 2L + 2W$$

are formulas for percentage, the area of a triangle, and the perimeter of a rectangle, respectively.

One useful application of the equation-solving skills we considered in Section 2.1 is in rewriting these formulas, also called **literal equations**, in more convenient equivalent forms.

Generally, that more convenient form is one in which the original formula or equation is solved for a particular variable or letter. This is called **solving the equation for a variable**, and the steps used in the process are very similar to those you saw earlier in solving linear equations.

Consider the following example.

Example 1

Solving a Literal Equation

Solve the formula

$$d = r \cdot t \quad \text{for } t$$

This formula gives distance d in terms of a rate r and time t .

To solve for t means to isolate t on one side of the equation. This can be done by dividing both sides by r . Given

$$d = r \cdot t$$

we use the multiplication property of equations to divide by r , the coefficient of t .

$$\frac{d}{r} = \frac{r \cdot t}{r}$$

$$\frac{d}{r} = t$$

We usually write the equation in the equivalent form with the desired variable on the left. So

$$t = \frac{d}{r}$$

We now have t in terms of d and r , as required.

CHECK YOURSELF 1

Solve the formula $C = 2\pi r$ for r .

NOTE A literal equation is any equation that involves more than one variable or letter.
