After 10 billion years, the small star will run out of hydrogen and starts fusing helium, which causes the star to expand to a red giant

Planetary Nebula

After the star runs out of helium, the star will try to combine carbon, which the star can't combine. So the gas spreads apart from the star leaving behind a carbon dense white dwarf.

When the white dwarf runs out of its remaining energy, it loses its brightness and becomes a brown dwarf.

After the star explodes, the star can do two different things based on its size

1. It can form a very dense NEUTRON STAR
2. It can form the most densest object in the universe, a BLACK HOLE

**The Early Universe with the VLT** Jacqueline Bergeron, 2013-11-11 This is the second ESO workshop in a series dedicated to science opportunities with the VLT At the first workshop all areas of astronomical research were discussed This second workshop is dedicated to research projects on the early Universe and has provided a forum for discussing strategies for studying faint distant objects in the optical and infrared spectral regions This field is evolving very rapidly There are several new surveys of galaxies and clusters of galaxies at intermediate redshift and quasars at very high redshift Major advances in the morphological studies of distant galaxies surveys of galaxies at high redshift and searches for primeval galaxies have been rendered possible by the new facilities provided by the Hubble Space Telescope and the Keck Telescope Observational constraints on the evolution and formation of galaxies and large scale structures as well as the cosmic chemical evolution were critically discussed with regard to theory and numerical simulations In this context the VLT first generation instrument capabilities were presented comprehensively and their use as

cosmological tools discussed The concluding remarks of the workshop focussed on the analysis of various possibilities for the VLT second generation instrumentation Many of these topics were covered by invited reviews and talks as well as some contributed talks They are included in this volume together with the poster papers

**Elements and the Cosmos** Bernard Ephraim Julius Pagel, 1992-10-15 While there have been many books on cosmology and galactic and stellar evolution in which abundance analysis of astrophysical objects has played some part this book is the first one for several years where specialists in the various relevant fields discuss the basis and implications of the subject as a whole The major aim of the book is to bring together the results from high redshift studies and galactic studies in a coherent way and to cover relevant aspects of nuclear and atomic physics
