Advances in Microbial Control of Insect Pests Rajeev K. Upadhyay, 2013-04-17 The insect 1 remain in symbiotic
associations with a tremendous number of microorganisms and some of them could be classified as parasitic pathogenic
Without question insect pathogens act as natural mortality agents and represent the third leg of the triad of biological control
which is an environmentally sound alternative to chemical control The virulence and pathogenicity of an insect parasite i e
disease agent are determined by the microbial genome as a result of the coordinated expression of a concert of genes These
genes may be organized as cassettes and be associated with transmissible DNA The acquisition of these domains or
pathogenicity islands may be sufficient to develop a transgenic virulent pathogen The insect pathogens are very specific and
this property can be exploited in making insects sick However rarely have field applications of highly virulent strains of
viruses fungi bacteria protozoa resulted in massive insect population reductions or induced widespread persistent epizootics
as the same is also governed by host susceptibility regulated by genetics age sex and physiological state of the host Insect
pathogens causing acute or chronic diseases must be able to persist in the environment to multiply in the host and to spread
to other susceptible hosts In this book I have attempted to bring together all recent studies regarding both fundamental and
more applied research aspects related to entomopathogens bacteria viruses fungi and nematodes in order to facilitate their
