Animal Allergens: Common Protein Characteristics Featuring their Allergenicity Christiane Hilger,Annette Kuehn,2015-07-13 Among the many molecules present in our environment some have the property to induce allergic sensitization and IgE mediated reactions The analysis of known major animal allergens has shown that most belong to single protein families lipocalins and serum albumins for inhalant allergens EF hand proteins tropomyosins and caseins for the digestive allergens The finding that allergens are often clustered in large families may be related to the fact that common structural biochemical or functional features contribute to their allergenicity in addition to external adjuvant factors Currently there is no curative treatment for animal allergy available In order to lower allergic reactions to respiratory allergens in daily life and to food allergens upon accidental exposure it is important to desensitize concerned patients Tolerance induction by allergen specific immunotherapy is in the current focus of an ambitious research This Research Topic aims to provide a comprehensive view of the basic and recent insights on the allergenicity of animal allergens in view of their structural and functional aspects as well as allergen specific immunotherapy
