Dynamic Analysis of Non-Linear Structures by the Method of Statistical Quadraticization M.G. Donley, Pol Spanos, 2012-12-06 1 1 Introduction As offshore oil production moves into deeper water compliant structural systems are becoming increasingly important Examples of this type of structure are tension leg platforms TLP's guyed tower platforms compliant tower platforms and floating production systems The common feature of these systems which distinguishes them from conventional jacket platforms is that dynamic amplification is minimized by designing the surge and sway natural frequencies to be lower than the predominant frequencies of the wave spectrum Conventional jacket platforms on the other hand are designed to have high stiffness so that the natural frequencies are higher than the wave frequencies At deeper water depths however it becomes uneconomical to build a platform with high enough stiffness Thus the switch is made to the other side of the wave spectrum The low natural frequency of a compliant platform is achieved by designing systems which inherently have low stiffness Consequently the maximum horizontal excursions of these systems can be quite large The low natural frequency characteristic of compliant systems creates new analytical challenges for engineers This is because geometric stiffness and hydrodynamic force nonlinearities can cause significant resonance responses in the surge and sway modes even though the natural frequencies of these modes are outside the wave spectrum frequencies High frequency resonance responses in other modes such as the pitch mode of a TLP are also possible

Coupled Boundary and Finite Element Methods for the Solution of the Dynamic Fluid-Structure Interaction Problem Siamak Amini, Paul J. Harris, David T. Wilton, 2012-12-06 This text considers the problem of the dynamic fluid structure interaction between a finite elastic structure and the acoustic field in an unbounded fluid filled exterior domain The exterior acoustic field is modelled through a boundary integral equation over the structure surface However the classical boundary integral equation formulations of this problem either have no solutions or do not have unique solutions at certain characteristic frequencies which depend on the surface geometry and it is necessary to employ modified boundary integral equation formulations which are valid for all frequencies The particular approach adopted here involves an arbitrary coupling parameter and the effect that this parameter has on the stability and accuracy of the numerical method used to solve the integral equation is examined The boundary integral analysis of the exterior acoustic problem is coupled with a finite element

analysis of the elastic structure in order to investigate the interaction between the dynamic behaviour of the structure and the associated acoustic field Recently there has been some controversy over whether or not the coupled problem also suffers from the non uniqueness problems associated with the classical integral equation formulations of the exterior acoustic problem This question is resolved by demonstrating that the solution to the coupled problem is not unique at the characteristic frequencies and that it is necessary to employ an integral equation formulation valid for all frequencies
