

Applications of Area, Length and Distances

1. A sector of a circle is a region of the circle bounded by a central angle and the corresponding arc.

As given in the following activity, between the central angle knowing the sector and the complete circle, there have previously determined a relation that could be written provided that arc length of a circle is called l (given a central angle) value or diameter of circle. This function gives the relation for arc length of a circle of radius r in given degree.

$$\text{Arc Length} = \frac{\theta}{360} \times \text{Circumference of circle}$$

Another way to find given length is to think about part of whole relationship. As you collected that the given value in the previous activity, you determined that arc length is directly a function of the circle's circumference and can be expressed in terms of r . This relationship can be summarized proportionally as circle of any given radius, r , is written

$$\frac{\text{Arc Length}}{r} = \frac{\text{Circumference of Circle}}{r}$$

Similarly, you determined a function that could be written provided the arc length by a central angle in a circle of radius of diameter of radius r .

$$\text{Arc Length for length of Radius} = \frac{\theta}{360} \times \text{Circumference of circle}$$

As you collected that for given radius in the previous activity, you determined that, the arc length, area of a circle (or area swept) is proportional to the circle's circumference and can be expressed in terms of r . This relationship is summarized proportionally for a circle of any given radius, r is written

$$\frac{\text{Arc Length}}{r} = \frac{\text{Circumference of Circle}}{r}$$

Example: (Based on the above facts and necessary.)

1. If the radius of a circle is 10 cm and the angle is 60 degrees, find the arc length and area of the sector.
