Cell-Cell Channels František Baluška, Dieter Volkmann, Peter W. Barlow, 2007-08-10 The biological sciences are dominated by the idea that cells are the functionally autonomous physically separated discrete units of life This concept was propounded in the 19th century by discoveries of the cellular structuring of both plants and animals Moreover the apparent autonomy of unicellular eukaryotes as well as the cellular basis of the mammalian brain an organ whose anatomy for a long while defied attempts to validate the idea of the cellular nature of its neurons seemed to provide the final conclusive evidence for the completeness of cell theory a theory which has persisted in an almost dogmatic form up to the present day However it is very obvious that there are numerous observations which indicate that it is not the cells which serve as the basic units of biological life but that this property falls to some other subcellular assemblage To deal with this intricate problem concerning the fundamental unit of living matter we proposed the so called Cell Body concept which in fact develops an exceedingly original idea proposed by Julius Sachs at the end of the 19th century In the case of eukaryotic cells DNA enriched nuclei are intimately associated with a microtubular cytoskeleton In this configuration as a Cell Body these two items comprise the fundamental functional and structural unit of eukaryotic living matter The Cell Body seems to be inherent to all cells in all organisms

Introduction to Genomic Signal Processing with Control Aniruddha Datta, Edward R. Dougherty, 2018-10-08 Studying large sets of genes and their collective function requires tools that can easily handle huge amounts of information Recent research indicates that engineering approaches for prediction signal processing and control are well suited for studying multivariate interactions A tutorial guide to the current engineering research in genomics **Introduction to Genomic Signal Processing with Control** provides a state of the art account of the use of control theory to obtain intervention strategies for gene regulatory networks The book builds up the necessary molecular biology background with a basic review of organic chemistry and an introduction of DNA RNA and proteins followed by a description of the processes of transcription and translation and the genetic code that is used to carry out the latter It discusses control of gene expression introduces genetic engineering tools such as microarrays and PCR and covers cell cycle control and tissue renewal in multi cellular organisms The authors then delineate how the engineering approaches of classification and clustering are appropriate for carrying out gene based disease classification This leads naturally to expression prediction which in turn leads to genetic regulatory networks The book concludes with a discussion of control approaches that can be used to alter the behavior of such networks in the hope that this alteration will move the network from a diseased state to a disease free state Written by recognized leaders in this emerging field the book provides the exact amount of molecular biology required to understand the engineering applications It is a self contained resource that spans the diverse disciplines of molecular biology and electrical engineering
