

Figure 9-13 The basic 555-timer configuration for a 50% duty cycle in astable mode

555 Astable Mode

A basic schematic for a 555 timer operating in an astable mode is shown in Figure 9-13. Once again, an LED is attached to the output for demonstration purposes. If the pulse width exceeds the period of the pulse, a small loadspeaker can be used instead, in series with a 470-ohm resistor and a 100-ohm capacitor.

Figure 9-14 A 555 timer with variable component values, configured to create a 50% duty cycle in astable mode

Separate Control of High and Low Output Times

In Figure 9-13, a 555 timer has been set up around R_2 . The capacitor now charges only through R_1 , so the discharge has a much lower time constant than R_2 . It discharges through R_2 , so the discharge time constant is double. Consequently, the length of the output pulse can be adjusted with the value R_1 only, while the length of the low output can be adjusted with the value of R_2 only. The duration of the high output can be less than or equal to the duration of the low output, but it is not possible with the basic configuration of components in Figure 9-13.

Figure 9-15 In this circuit, a dual potentiometer can adjust the “on” time and the “off” time of the 555 timer and 50% independently. If each slider sets R_1 and R_2 to 10k ohms.

555 Fifty Percent Astable Duty Cycle: 1

In Figure 9-16, the circuit creates a 50% duty cycle output duration of approximately 50% again, 50% low. Initially, C_1 has no charge (only the input of the timer low, and causing the output cycle with a high pulse from the Output pin).

Since in this demonstration circuit, the output illuminates an LED. At the same time, capacitor C_1 is precharged to the output and charges C_1 . When the voltage on C_1 reaches 2/3 of 5V, this is compared to the threshold input, which sends the “high” pulse and initiates the output on the Output pin. This starts to take the charge from C_1 through R_1 . When the voltage drops to 1/3 V, this initiates a new cycle. Because only one resistor is used to charge and discharge the capacitor, as you might think that the charge and discharge times should be identical. However, a higher load on the output will probably pull down the output voltage to some extent, lengthening the charge time. Conversely, a load on the Output pin that has low resistance will probably leak at least some of the charge from the capacitor during the discharge cycle.

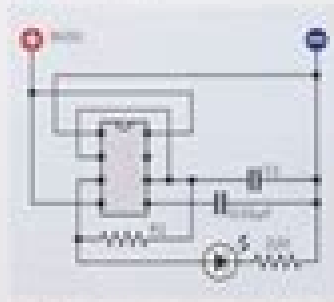

Figure 9-16 The configuration creates an approximately 50% on/off duty cycle at the output pin, although the potentiometer can adjust the load.

555 Fifty Percent Astable Duty Cycle: 2

In Figure 9-17, a small modification of the basic astable circuit shown in Figure 9-14 provides an other way to enable a 50% duty cycle. Compare the two schematics, and you will see that just the connection between R_1 and R_2 has been altered so that C_1 now charges only through R_1 , and the

charges only through R_2 . However, in this configuration the capacitor is discharging into a variable divider created by the two resistors. Slight adjustments of the resistor values may be necessary before the duty cycle is precisely 50%.

Figure 9-17 In previous configurations, the potentiometer can adjust the duty cycle and frequency.

Use of the 555 Control Pin

In Figure 9-18, a potentiometer and two series resistors allow a varying voltage to be applied to the Control Pin. This will lengthen or reduce both the charge and the discharge times of the timing capacitor. If values for the capacitor and its associated resistors are chosen to create a frequency of approximately 100Hz, a 10k potentiometer should demonstrate more than an octave of an octave through the loadspeaker. Other components can be substituted for experimentation, creating possibilities for producing pulse-width modulation. Alternatively, if a large capacitor is added between the Control pin and ground, only a second 100 tones, varying slowly in an astable mode, applied to output to the Control pin, the charging and discharging of the capacitor will apply a smoothly rising and falling voltage. If the first 100 tones is running at an audio frequency, the output will have a “beating tone” effect.
