

Total storage depth	The effective depth of water stored within the bioretention cell. It is a function of ponding depth, sump storage, bioretention medium thickness and porosity, and the thickness and porosity of the optional stone storage layer.	Typically 0.75 to 4 ft
Design media filtration rate	The rate at which water is assumed to enter and move through the engineered filter media	Typically greater than 2 in./hr and less than 12 in./hr
Design soil infiltration rate	The rate at which water is assumed to infiltrate into the subsurface soils for the purpose of design and benefit evaluation. This should be the rate of infiltration below the amended soil layer or stone reservoir.	Any; partial infiltration (upturned elbow design) can be used as low as approximately 0.01 in./hr
Underdrain discharge stage	The stage at which water begins to discharge from the underdrains (typically controlled via upturned elbow)	Typically 0.5 to 2 ft above the bottom of the storage reservoir, if internal water storage is provided
Sump storage	The effective depth of water stored within the sump layer below the outlet elevation of the underdrain (typically controlled via upturned elbow)	Typically 0.2 to 0.8 ft, accounting for porosity of stone below underdrain discharge stage

Example Conceptual Design Schematic
