Hydraulic Analysis and Design of Water Supply Network (case Study of Existing Water Supply Distribution System of Multimedia University, Cyberjaya) Muthusamy Sinnappan, 2002 As water demand is increasing in recent years and with the limited raw water sources available efficient operation of water supply systems is necessary to increase potable water production and distribution reduction in cost to the utility company and benefits to the consumers This study was carried out to gauge the performance of Multimedia University's MMU existing water supply distribution system provisions for Phase 1 of MMU Development WATNET Software was used to simulate the flow in pipe network The performance of WATNET Software was validated using field data collected from the existing water supply system under operation It was also checked whether the design parameters and criteria selected for the water supply system design by the designers are appropriate and in compliance with the relevant guidelines and standards For this purpose desk study detailed design analysis and field measurements were necessary Comparisons were done between the designed system and field measurements Drinking water quality obtained from the reticulation system was also tested at the laboratory for compliance to drinking water quality standards Based on the results it was concluded that the overall distribution system is sufficient for Phase 1 of MMU development and is in compliance with the requirements However necessary measures need to be taken to improve the quality of the drinking water i.e. free residual chlorine content The existing reticulation mains are also able to convey an additional 2000m³ day of water for future MMU developments but with the modification extension of the pumping and storage system
