

ENDOCRINE SYSTEM

Endocrine System: WORKING TOGETHER

Each organ system works on other systems within the body to do its "job". Our bodies learn just some of the ways that the endocrine system interacts with other organ systems.

Nervous System

Circulatory System

Endocrine System: FACTS

Endocrine System: PROBLEMS

Most of the time, the endocrine system works perfectly well. However, sometimes problems can arise.

Diabetes

Diabetes is a condition that causes high blood glucose (sugar) levels. It is caused by the body being unable to either produce or use the hormone insulin. So, the glucose in the blood gets stuck or "stuck". Symptoms include increased thirst, weight loss, frequent urination, blurred vision, slow wound healing, and changes in mood, vision, or tingling in the hands.

Endocrine System: KEY TERMS

Term	Definition
Endocrine System	Network of endocrine glands that make, store, and release hormones.
Hormones	Chemical messengers that carry information and instructions from one cell to another.

Endocrine System: HORMONES

Hormones are chemical signals. Hormones are released into the bloodstream by endocrine glands. They travel through the bloodstream and bind to target cells, which then respond to the signal. Hormones can affect many different parts of the body, such as growth, metabolism, and reproduction.

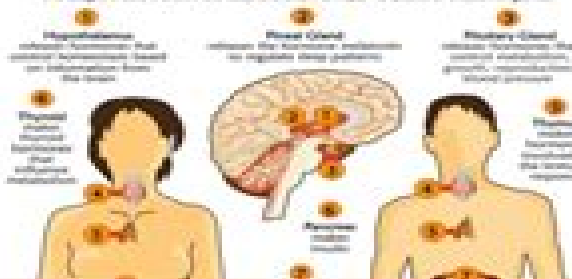

Endocrine System: FIGHT-OR-FLIGHT

The fight-or-flight response is a reaction that occurs in the body when we are really frightened. The body's fight-or-flight response is the body's way of reacting to a dangerous situation. When we are scared, our body releases hormones that make us feel alert and ready to act. These hormones also make our heart beat faster and our breathing deeper. This helps us to run away from danger or fight back. The fight-or-flight response is a natural reaction that helps us to survive in dangerous situations.

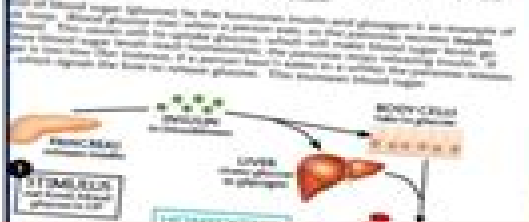

Endocrine System: GLANDS

A gland is a structure that produces and releases substances that perform a specific function in the body. There are many different types of glands in the body, each with its own specific function. Some glands produce hormones, while others produce sweat, tears, or saliva. The endocrine system is made up of glands that produce hormones. These hormones travel through the bloodstream and affect other parts of the body.

Endocrine System: FEEDBACK LOOPS

Endocrine activities are regulated by complex feedback loops. These feedback loops help the body maintain balance. When a hormone level is too high or too low, the body sends a signal to the glands to produce more or less of that hormone. This signal is called a feedback loop. The feedback loop helps the body to keep hormone levels within a normal range.
