

Energy Transfer in Living Organisms

How does energy move through an organism?

Why?

The **law of conservation of energy** states that energy can be neither created nor destroyed; it can only be transferred to another form. In living things energy is transferred as organic matter (molecules of carbohydrate, fats, starch, etc.). But does an organism use all of the energy that is provided by the organic matter available? How is the law of conservation of energy applied to living organisms?

Model 1 – Food Conversion in a Herbivore

1. According to Model 1, how many grams of grass does herbivore A eat each day?
2. Refer to Model 1.
 - a. How much did herbivore A grow from eating this grass?
 - b. What term is used to represent growth in Model 1?
3. What is meant by "egested waste" as it is used in Model 1?
4. Is all of the mass of the ingested grass accounted for in the growth and waste of herbivore A? If not, how much is "missing"? Show a mathematical calculation to support your answer.

Next Generation Science Standards NGSS Lead States, 2013-08-15

Next Generation Science Standards identifies the science all K-12 students should know. These new standards are based on the National Research Council's A Framework for K-12 Science Education. The National Research Council, the National Science Teachers Association, the American Association for the Advancement of Science, and Achieve have partnered to create standards through a collaborative state-led process. The standards are rich in content and practice and arranged in a coherent manner across disciplines and grades to provide all students an internationally benchmarked science education. The print version of Next Generation Science Standards complements the nextgenscience.org website and provides an authoritative offline reference to the standards when creating lesson plans. Arranged by grade level and by core discipline, making information quick and easy to find. Printed in full color with a lay-flat spiral binding. Allows for bookmarking, highlighting, and annotating.

Yufik,Biswa Sengupta,Karl Friston,2017-11-30 This special issue reviews state of the art approaches to the biophysical roots of cognition These approaches appeal to the notion that cognitive capacities serve to optimize responses to changing external conditions

Crucially this optimisation rests on the ability to predict changes in the environment thus allowing organisms to respond preemptively to changes before their onset. The biophysical mechanisms that underwrite these cognitive capacities remain largely unknown although a number of hypotheses has been advanced in systems neuroscience, biophysics and other disciplines. These hypotheses converge on the intersection of thermodynamic and information theoretic formulations of self organization in the brain. The latter perspective emerged when Shannon's theory of message transmission in communication systems was used to characterise message passing between neurons. In its subsequent incarnations the information theory approach has been integrated into computational neuroscience and the Bayesian brain framework. The thermodynamic formulation rests on a view of the brain as an aggregation of stochastic microprocessors, neurons, with subsequent appeal to the constructs of statistical mechanics and thermodynamics. In particular the use of ensemble dynamics to elucidate the relationship between micro scale parameters and those of the macro scale aggregation, the brain. In general the thermodynamic approach treats the brain as a dissipative system and seeks to represent the development and functioning of cognitive mechanisms as collective capacities that emerge in the course of self organization. Its explicanda include energy efficiency enabling progressively more complex cognitive operations such as long term prediction and anticipatory planning. A cardinal example of the Bayesian brain approach is the free energy principle that explains self organizing dynamics in the brain in terms of its predictive capabilities and selective sampling of sensory inputs that optimise variational free energy as a proxy for Bayesian model evidence. An example of thermodynamically grounded proposals in this issue associates self organization with phase transitions in neuronal state spaces resulting in the formation of bounded neuronal assemblies, neuronal packets. This special issue seeks a discourse between thermodynamic and informational formulations of the self organising and self evidencing brain. For example could minimization of thermodynamic free energy during the formation of neuronal packets underlie minimization of variational free energy.

Modern Conformational Analysis Helena Dodziuk, 1996-12-17
Most books on organic conformational deal with stereochemistry while neglecting the spatial structure of organic molecules especially the unusual ones. This ambitious monograph presents a global view of organic structure and conformational analysis in a very readable style. The author's fascination with the beauty and variety of shapes of organic molecules comes through in her description of the importance of molecular organization in organic chemical and biological systems, the quantum foundations of molecular spatial structure, molecular symmetry, chirality and physical methods for studying molecular geometry. She provides ample bases for the new trends in organic conformational chemistry including the application of Computer Assisted Molecular Design (CAMD) to organic synthesis.
